REFERENCE NOTES

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES: Dates in the table apply to the period 24 hours prior to time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. (See individual Climatological Data for times of observations).

+ And also on an earlier date or dates.
D Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
U Indicates Urban site.
R Indicates Rural site.
Ø Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
°F = $\frac{9}{5} \times °C + 32$
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

U Indicates Urban site.
R Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

U Indicates Urban site.
R Indicates Rural site.

STORM SUMMARY:

° Includes crop damage.
C Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
! Includes heavy sleet storm
Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
‡ No Storm Data Report received for this State.
<> Report Incomplete.
† Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5 Million
7	$5 Million to $50 Million
8	$50 Million to $500 Million
9	$500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

1/ Flooding continued at the end of the month.
NA Not available.

FLOOD STAGE DATA:

# Highest Stage Observed
1/ Continued at end of month
___ Highest Stage of Record
E Estimated
P Provisional (Flood Stage)
U Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
+ Observations for these stations are scheduled at 0000 G.C.T.
† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

REFERENCE NOTES

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

( )	Clouds Present	DM	Moderate Dust	HM	Moderate Haze	KS	Slight Smoke
*	Values corresponding to true solar noon	DS	Slight Dust	HS	Slight Haze	M	Moderate Haze-indeterminable
BD	Blowing Dust	F	Fog	I	Intense Haze-indeterminable		
BN	Blowing Sand	GF	Ground Fog	K	Smoke	N	Sand
D	Dust	H	Haze	KI	Intense Smoke	S	Slight Haze-indeterminable
DI	Intense Dust	HI	Intense Haze	KM	Moderate Smoke		

SOLAR RADIATION TOTALS: Langley is the unit used to denote one gram calorie per square centimeter.

* Values with an asterisk are interpolated.
Data are only for those stations equipped with Eppley Model II sensors.

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega\ \Omega\ \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

SEPTEMBER 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

HIGHLIGHTS: Cooler than normal temperatures prevailed across most of the Nation in Septemper. Exceptions to this trend, areas west of the Rockies and the extreme Southeast averaged above normal readings. Throughout most of the Nation monthly precipitation totals were generally well above or well below normal. The eastern quadrant got the heaviest soaking when remnants of Hurricane Eloise poured 8 to 14 inches on that area during the last week of the month. Total September rainfall measured generally below normal in the Great Plains, Corn Belt, and extreme Northwest.

September marked a seasonal change for the Northwest and Northeast when cold air moved southward from Canada at the beginning of the month. Across much of the Plains, nighttime temperatures signaled fall's arrival and dipped into the 40°'s and 50°'s. Frost turned up for the first time in the Colorado Rockies and Montana on the 2d--the same day that Omaha, NE, read a new record high of 100°. In portions of the West, temperatures ranged up to 20° above normal.

Most precipitation amounts during the first week were light, although a few severe thunderstorms produced tornadoes, strong winds, and hail in parts of the Ohio and Mississippi Valleys.

Cold temperatures broadened their coverage during the 8th-14th, when a mass of cool air left behind record lows and some frost as it made its way towards the Atlantic. On the morning of the 12th, new record lows were chalked up for Sheridan, WY, 30° and Kansas City, MO, 45°. In the Great Lakes region temperatures slipped as low as 20° below normal during the second week of the month. West of the Divide, warm air and clear skies pushed the mercury into the 80°'s and 90°'s. Thunderstorms during the week caused some damage in parts of the Midwest and isolated activity dotted the Gulf and southern Atlantic Coasts.

As a result of a cold front, unseasonably cool temperatures persisted into the third week of September and on the 15th more record lows were added to the list: Albany, NY, 33°; Raleigh, NC, 45°; and Richmond, VA, 44°. Showers and thundershowers associated with the front spread from the Great Plains into the Ohio and Mississippi Valleys. Locally heavy rains drenched parts of the Southwest and south central Plains. Meanwhile a high pressure system kept weather warm and dry in the Pacific Northwest. On the 16th tropical storm Eloise came to life in the southern Atlantic.

The last week of the month registered a number of weather extremes across the Nation. On the 23d, a week after Eloise first showed up in the Atlantic, the eye of the hurricane moved inland, delivering rains that caused flooding in many eastern areas. Pennsylvania and New York States were especially hard hit. By the 30th precipitation in the East diminished but damaging floods served as a reminder of the storm. In contrast, in the Northwest, Septemper ended as a record dry month for Washington and Oregon. Final tallies showed that Seattle, WA, received only a trace of rain during September compared to its monthly normal of almost 2 inches. In Astoria, OR, where normal for the month is 2.83 inches, only .04 inches of rain fell.

HURRICANE ELOISE

SEPTEMBER 13 - 24, 1975

National Hurricane Center, NOAA
Miami, Florida

METEOROLOGICAL HISTORY

The disturbance which spawned Eloise left the African west coast on September 6 as a rather unimpressive system on satellite pictures, although the Dakar, Senegal, upper air sounding gave evidence of a fairly strong cyclonic circulation at lower levels. The disturbance moved westward at an average speed of 13 knots during the next six days with satellite pictures and ship reports giving evidence of a very gradual increase in convection and organization.

The first sign that a weak depression had formed came early on the 13th when the Netherlands tanker GULF HANSA (PELP) reported northerly winds of 20 kt and seas up to 10 feet. Later that morning an Air Force reconnaissance aircraft located the center about 600 miles east of the Virgin Islands. Satellite pictures, ship, and reconnaissance reports during the next 48 hours confirmed a trend of slow intensification. A reconnaissance aircraft found that winds had reached tropical storm strength during the early morning hours of the 16th, and the first advisory on Eloise was issued by the San Juan Hurricane Warning Office at 6 AM AST. Previously, bulletins had been issued since the 13th warning the northern Leewards, Virgin Islands, and Puerto Rico of heavy rains and gusty winds to gale force.

Eloise strengthened rapidly and NOAA aircraft reported winds reached minimal hurricane force prior to its striking the northeast coast of the Dominican Republic late on the 16th. For the next 36 hours the center and much of the circulation was over land. Falling pressures to the northwest of Eloise were expected to keep the center north of the Dominican Republic and Cuba. However, the center tracked westward across extreme southeastern Cuba into the northwestern Caribbean Sea north of Jamaica.

The mountainous terrain of Hispaniola and Cuba caused Eloise to weaken to a minimal tropical storm with a marked decrease in associated rainfall by the time the center finally emerged over open water.

A favorable upper level flow pattern continued over the storm, as it had since the 13th, with anticyclonic outflow enhanced by a cold low traveling westward about 500 miles in advance. The lower level circulation had been distorted by the encounter with land and was also somewhat adversely affected by an approaching trough from the west. Even though the center was over the open, warm waters of the Caribbean Sea and rising pressure to the north were contributing to more favorable low level conditions, Eloise remained poorly organized until it approached the northeast coast of Yucatan late on the 20th with winds of gale force mainly in squalls northeast of the center. From the time the center approached the Dominican Republic until it moved into the central Gulf of Mexico, it varied from 40 to 60 miles in diameter. Reconnaissance reports and upper air soundings suggested a fairly large slope of the center with height from the surface prior to its reaching the Gulf of Mexico, and satellite pictures continually showed the heaviest convection well south and east of the center. Lack of reconnaissance and surface reports while the broad center was over the Dominican Republic, Cuba, and adjacent waters has led to more than normal uncertainty in the locations and intensities on the best track from the 17th at 00Z to 12Z of the 21st.

An approaching upper level trough in the westerlies caused Eloise to turn to the north after crossing the Yucatan peninsula just north of Cozumel, Mexico. This enhanced an already favorable outflow pattern aloft, while rising pressures around the storm had made low level conditions more favorable for intensification. Eloise began a steady strengthening north of the Yucatan peninsula, regaining hurricane force in the central Gulf of Mexico about 350 miles south of New Orleans on the morning of the 22d. The hurricane continued strengthening until landfall about midway between Fort Walton Beach and Panama City shortly after 8 AM EDT on the 23d. At that time it was moving north northeast at better than 20 knots, and had been monitored continuously by Air Force reconnaissance aircraft and National Weather Service radar at Pensacola, Apalachicola, and Slidell (New Orleans) during the last 12 hours prior to landfall.

The hurricane weakened rapidly after landfall as drier, colder air was drawn into its circulation. It was downgraded to a tropical storm by noon while over east central Alabama, a tropical depression by early evening while over eastern Tennessee, and lost all tropical characteristics by the time it reached extreme western Virginia on the morning of the 24th.

A low pressure center identifiable as the remnant of Eloise was no longer discernable by late on the 24th. However, the moisture brought northward by the hurricane combined with an old frontal system over the northeastern United States to produce heavy rainfall and serious flooding until skies cleared on the 27th.

METEOROLOGICAL DATA
DEATHS, DAMAGE ESTIMATES

1. Northern Leeward Islands, Virgin Islands, Puerto Rico, Dominican Republic, and Haiti.

The primary effects of Eloise in these areas was flooding resulting from torrential rains and consequent deaths and damages. Total storm rainfall amounts ranged from 5-10 inches from St. Kitts and St. Martin westward across St. Croix to Puerto Rico with amounts of 10-20 inches common over eastern and southwestern Puerto Rico. The greatest total reported was 26.7 inches near Sabana Grande in southwest Puerto Rico. Lesser amounts of 1-3 inches fell at St. Thomas and other northern Leeward Islands. No storm totals are available from Hispaniola but incomplete rainfall observations and satellite pictures indicate torrential rains occurred over the eastern and southern portions of the Dominican Republic and southern Haiti.

River and flash floods and landslides caused most of the deaths in this area. Press accounts report 18 deaths in southern Haiti and 7 deaths in the Dominican Republic. There were 34 confirmed deaths in Puerto Rico. Property damage in Puerto Rico is estimated in excess of $60 million with no estimates elsewhere.

The strongest winds were north of the center and remained offshore from Puerto Rico and the Dominican Republic. St. Croix had a gust to 45 knots. Ponce and Mayaguez in Puerto Rico, had gusts to 35 kt. The maximum sustained wind of 45 knots was reported from Cape Engano on the northeastern tip of the Dominican Republic.

2. Extreme southeastern Bahamas, Cuba, Jamaica, Cayman Islands, northeast Yucatan.

Eloise weakened throughout most of the period it was affecting these areas. In addition, satellite pictures indicated most of the heavier rainfall missed the land areas. A squall of 45 knots occurred on Cayman Brac during the afternoon of the 19th. Sustained winds of 40 knots were reported along the southeast coast of Cuba on the 18th. There were no other reports of high winds, and no deaths or significant damage reports from this region.

3. United States.

a. Southeast.

Eloise strengthened until reaching the coast with the minimum pressure of 955 mb observed at Destin, FL. The maximum sustained surface winds during Eloise's lifetime were estimated to be 110 knots, also at landfall, although flight level winds reported by reconnaissance aircraft at 700 mb were somewhat higher.

The highest sustained winds along the coast were not measured as most wind measuring equipment failed. However, a gust to 135 knots was observed on a 98-foot tower located 13 miles offshore from Panama City. Winds of hurricane force were reported from Fort Walton Beach to Panama City and northward into extreme southeastern Alabama. Gales were reported from the southeastern Louisiana delta to Cedar Key, FL, and northward over most of Alabama and western Georgia to extreme southeastern Tennessee.

Preliminary measurements indicate hurricane tides of 12-16 feet above normal occurred from just east of Fort Walton Beach to south of Panama City. Tides of 6-12 feet were reported eastward to Port St. Joe with 3-5 feet elsewhere in the gale warning area, and 2-3 feet along the Florida west coast from Naples northward to Cedar Key.

Preliminary reports indicate 10 or more tornadoes occurred from northwestern Florida to western North Carolina, causing no deaths and only minor damage.

Rainfall amounts ranged from 4 to 8 inches from extreme southeastern Louisiana to the Panama City area and northeastward to the western Carolinas. The greatest total reported was 14.9 inches at Eglin Air Force Base, FL.

There were four storm related deaths, although none occurred as a direct result of the winds or storm surge during the passage of Eloise. Most of the estimated $100-150 million damage occurred along the 25-mile Panama City Beach Strip, mainly as a result of the high tides undermining the beachfront structures.

Approximately 100,000 residents from southeastern Louisiana to northwestern Florida evaucated before Eloise reached the coast.

b. Northeast.

A low pressure center identifiable as the remnants of Eloise was no longer apparent late on the 24th. However, the combination of the moisture brought northward by Eloise and a stagnant frontal zone produced rainfall amounts of 4-10 inches over a large area from northern Virginia and Maryland through Delaware and New Jersey, into the eastern half of Pennsylvania, and southeastern and south central New York state.

Major flooding took place on the Chemung, Susquehanna, Potomac, and Shenandoah rivers with flash floods along smaller rivers and streams.

The 17 deaths in the area were mostly drownings. Damages are estimated at 300 million dollars with the bulk of it occurring as crop and road damage.

FORECASTS AND WARNINGS

Warnings of flooding from heavy rains were given for Puerto Rico and the Virgin Islands 24 hours or more in advance. Hurricane warnings for the Dominican Republic were issued less than 12 hours in advance because of the rapid intensification of Eloise.

Although hurricane warnings were issued 24 hours in advance for the Gulf coast area devastated by Eloise, and the forecast error for landfall was about the average for landfalling U.S. storms/hurricanes, the rather early mention of a landfall point led to some mis-interpretation of the warnings, and a subsequent delay in action on evacuation.

Eloise generated hurricane tides somewhat higher than previous numerical and empirical techniques had indicated for a hurricane of this strength. The peak surge rose rapidly, lasting about 30 minutes. The presence of sand dunes in the landfall area may have contributed to some of these effects, but further study is needed before any definite conclusions can be made. There is little doubt, however, that the erosion of the sand dunes led to much of the destruction along the beaches.

HURRICANE FAYE

SEPTEMBER 18 - 29, 1975

National Hurricane Center, NOAA
Miami, Florida

A tropical disturbance moved westward off the African coast on September 14th and during the next few days gradually developed the characteristics of a tropical depression. The center of the depression was first located by satellite pictures 500 miles west of the Cape Verde Islands on the 18th.

On the 19th satellite classification indicated the system had attained winds of tropical storm strength, and it was designated Faye. Tropical Storm Faye moved steadily westward until the 23d when strong wind shear associated with an upper level trough began to weaken the storms circulation and Faye was downgraded to a depression about 500 miles northeast of the Leeward Islands.

The depression turned northward temporarily on the 24th and began to move into a more favorable circulation pattern. Faye regained tropical storm and then hurricane strength during the 25th and began a northwesterly movement that would continue until the 27th, with the center passing just east of Bermuda on the evening of the 26th.

Faye turned toward the north shortly after passing Bermuda and by the afternoon of the 27th came under the influence of strong westerly flow which dominated the North Atlantic north of latitude 40N. Thereafter, Faye developed an east northeast to east course with rapid acceleration. The storm gradually lost all tropical characteristics as it moved eastward at 40 knots some 200 miles north of the Azores.

Damage to Bermuda was minor since the island remained on the weak side of the storm. Faye was not a severe hurricane with reconnaissance aircraft indicating the highest winds were 90 knots and lowest pressure 977 mb.

HURRICANE GLADYS

SEPTEMBER 22 - OCTOBER 3, 1975

National Hurricane Center, NOAA
Miami, Florida

The disturbance from which Gladys evolved followed the one which formed Faye by about four days as it crossed the eastern part of the tropical Atlantic. Faye took a more northern course near latitude 20N while the predecessor of Gladys followed to the southeast near latitude 11N.

No reconnaissance data nor ship reports were available from the immediate vicinity of the system from the time it was a tropical disturbance until two days after it became a hurricane. Therefore, estimates of the maximum wind and central pressure during this period are based on satellite photographs. These pictures suggest that a depression formed on September 22 and reached tropical storm intensity about 48 hours later. An eye became apparent on satellite pictures on the 25th and Gladys was upgraded to a hurricane.

Shortly after Gladys became a hurricane, it came under the influence of strong vertical wind shear which prevented further intensification. Gladys barely maintained hurricane strength for the next four days and winds may even have dropped below the hurricane threshold on the 28th as the central pressure rose to 1000 millibars.

However, as Gladys tracked west northwestward on the 29th, and the cold low which was east of the Bahamas receded to the southwest, the influence of the strong westerly shear ended and the hurricane deepened rapidly.

During the next two days, the forecast problem centered on the degree of persistence of the ridge to the north and its effect on the recurvature of the hurricane. Even though Gladys turned toward the north northwest on October 1, and was expected to turn toward the north on the following day, the threat to the Outer Banks of North Carolina was sufficient to warrant a hurricane watch, which was issued for the area from Cape Lookout to Kitty Hawk at 6 PM EDT, on the 1st. Because of rising tides and increasing swells of eight feet, local officials closed the Cape Hatteras National Seashore road and campground.

As the hurricane center passed about 300 miles east of Cape Hatteras, it reached its lowest pressure of 939 millibars with highest winds estimated 120 kts. This is one of the lowest recorded pressures in a hurricane that far north.

Gladys turned to the northeast and accelerated on the 2d. It became apparent that the center would miss the North American continent but it still posed a threat to the island of Newfoundland. The hurricane attained a forward speed of more than 50 mph and two reconnaissance planes were unable to penetrate the center due to severe turbulence. The center passed about 70 miles off Cape Race, Newfoundland, about daybreak on the 3d and gradually became extratropical as it sped northeastward and merged with a cold front during the day.

No reports of casualties or damage due to Gladys have been received.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

SEPTEMBER 1975

Herbert J. Thompson, Office of Hydrology

The major flood event of the month was that caused by the heavy rains associated with Hurricane Eloise. Preliminary estimates indicate total losses in excess of $475 million with 50 people dead. Hardest hit areas were Puerto Rico with 34 known dead and losses of $60 million, the Susquehanna River Basin with 9 dead and losses approaching $300 million, and the lower Hudson River Basin with 2 dead and losses of more than $64 million. Serious flood losses also resulted from Eloise in the Lake Ontario drainage, Connecticut, Maryland, and Virginia.

The serious flooding in the Great Lakes drainage in Michigan continued from August with record stages on the Little Muskegon and White Rivers.

Urban and flash flooding were widespread in the areas affected by Eloise and took 2 lives and caused significant property losses in some other areas. Most seriously affected were Rock Hill and Greenville County, SC, Pryor, OK, Raymondsville, TX, several communities in New Mexico and Arizona, and the Mojave Desert area of California.

These and other hydrologic events of unusual significance or involving loss of life or property damage are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ST. LAWRENCE DRAINAGE		
Great Lakes Drainage in Michigan	Heavy rainfall during the period August 29 to September 1, discussed in the August report, caused significant flooding over much of lower Michigan which continued into the first week of September. Major flooding occurred in the Muskegon and White Basins with record crest stages on the Little Muskegon and White Rivers. Damage in these two basins was estimated at $5.4 million by the Corps of Engineers. Significant flooding was reported on many streams in the Saginaw River Basin, including the Shiawassee, Tobacco, Chippewa, and Tittabawassee Rivers. Flood stages have not been determined on many of these streams. Minor flooding was reported in the upper Grand River Basin.	0	6,054
Lake Ontario Drainage	Heavy rainfall in excess of 5 inches associated with the remnants of Hurricane Eloise caused severe small stream flooding in portions of Cayuga, Onandaga and Oswego Counties. One reporting station on the Genessee River at Wellsville, NY, slightly exceeded flood stage on the 26th. Estimates of losses were: Cayuga, $2.9 million to agriculture, $500,000 to public property, and $500,000 to private property; Onadaga, $300,000 private, $200,000 public, and $150,000 agricultural; and Oswego, $1 million agricultural.	0	5,550
	ATLANTIC SLOPE DRAINAGE		
Connecticut and Housatonic River Basins	Heavy rainfall associated with the remnants of Hurricane Eloise occurred over portions of these basins during the 22d-27th. The axis of heaviest rainfall extended northeastward from New York City across western Connecticut into southern New Hampshire. Storm totals of nearly 10 inches fell over the Housatonic and Farmington River Basins. Flooding was generally light on the larger rivers.	2	9,360

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

SEPTEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	On the Farmington River, a major tributary of the Connecticut, a crest 2.5 feet over flood stage occurred at Simsbury, CT, and 1 to 2 feet of flooding was reported on the lower Connecticut River. However, a crest 5.7 feet over flood stage was reported on the lower Housatonic River at Stevenson, CT. The major damage resulted from severe urban and flash flooding with a total of 42 communities affected. Damage estimates are: private property in 18 communities, $5,928,000; public property in 40 communities, $2,915,000; highway damage, $277,000; and agricultural damage (mostly to the apple crop), $240,000. Damage was confined to the state of Connecticut. The most seriously affected communities were Danbury, $4,750,000; New Milford, $1 million. Watertown, $750,000; Shelton, $300,000; Torrington, $250,000; Middlebury, $250,000; Barkhamsted, $225,000; Woodbury, $200,000; Vernon, $142,000; Bristol, $125,000; Winsted, $125,000; and Ridgefield, $100,000. The worst flooding since 1955 was reported along the Naugatuck River. There were two flood-related deaths in Connecticut.		
Hudson River Basin (New York)	Heavy rains associated with the remnants of Hurricane Eloise totaled from 8 to 10 inches over the extreme lower portion of the Hudson River Basin. While no river reporting stations went over flood stage severe urban and flash flooding occurred with major damage in the area. The hardest hit area was Westchester County where preliminary estimates of losses totaled $41.5 million, of which $30 million was to private property, $10 million to public property, and $1.5 million to agriculture. In New York City most of the damage occurred in Queens where losses totaled $11.1 million of which $10 million was to private property and $1.1 million to public. In Rockland County private losses totaled $13 million and public losses $100,000. There were two flood-related deaths in Westchester County.	2	65,700
New Jersey Coastal and Delaware Basin Streams	Several periods of intense rainfall deposited amounts of 5 to 11 inches over New Jersey during the 5 days of the 22d-26th. This unusual meteorological activity has been described by the Philadelphia WSFO as follows: "A cold front moved through the district on the 21st and became stationary along the coast of New Jersey on the 22d. The portion of the front in the Gulf States began to move slowly northward on the 23d. A large area of precipitation north of the front remained over the district the next several days as weak low pressure areas moved along the front. The remnants of Hurricane Eloise were picked up by the southern portion of the front which continued its slow northward movement. A complex low pressure system formed and moved northeast into New Eng-	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

SEPTEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	land dragging the front east of the district during the early morning hours of the 27th. Measurable precipitation was observed over most of the district from the 19th through the 26th. A number of New Jersey streams went over flood stage, including the Ramapo, Rockaway, Saddle, Passaic, upper Millstone, Raritan, Assunpink, Rancocas, and Cooper Rivers. Flooding was reported along the Pompton River with 125 families evacuated in Wayne Township, but the recorder was inoperative and no data was available. Because the heavy rainfall occurred in several periods flooding was generally light and two crests were observed on a number of streams with three crests reported on the Assunpink River. A crest 6.5 feet over flood stage was determined from a high water mark on the Millstone River at Blackwell's Mills. About 2 feet of flooding occurred along the Passaic, Saddle, and Assunpink Rivers and 3.5 to 2.5 feet of flooding occurred along the Raritan River.		
Delaware River Basin (Pennsylvania)	No river flooding was reported in this basin. However, urban and small stream flooding took two lives. A 30-year old man drowned in a railroad underpass in Philadelphia and an 18-year old youth drowned while rafting on Tulpehocken Creek near Reading. Property losses are not known.	2	N.A.
Susquehanna River Basin	Record September rainfall over the Susquehanna Basin produced the greatest September flows of record. Flows were running somewhat higher than normal through the 23d when significant rainfall from the remnants of Eloise began to affect the area. Almost continuous rain from the 22d through the 26th produced totals of 5 to 7 inches over most of the basin and 10 to 15 inches over the lower and middle Susquehanna Valley. Amounts of similar magnitude were observed only during Agnes in June 1972. Small streams and creeks began to overflow their banks on the 24th, although the Susquehanna rose only moderately to one-half bankfull levels the afternoon of the 25th. Following several inches of intense rainfall over the entire basin and up to 8 inches in the Harrisburg area during the early morning hours of the 26th, however, the main stem began to rise at the rate of 8 to 12 inches an hour, reaching flood stage in most places by noon of the 26th. The river continued to rise until the afternoon of the 27th when crests of 5 to 13 feet above flood stage materialized. The 23.8 foot crest at Harrisburg was the sixth highest of record. Crests of 2 to 10 feet above flood stage were reached on the West Branch below Lock Haven on the 26th. Headwaters of the West Branch of the Susquehanna, as well as the entire reach of the Juniata, experienced no flooding as crests reached only three-fourths to near bankfull levels.	9	296,000

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

SEPTEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	In the headwaters of the Susquehanna River in New York State storm totals of 3.5 to 6.5 inches caused major flooding along the Chemung River and its tributary, the Tioga River. The crest of 24.0 feet at Chemung, NY, 12 feet over flood stage, was the second highest of record, exceeded only by the Agnes flood of June 1972 which reached a stage of 31.4 feet. The crests of 19.75 feet on the Chemung River at Elmira, NY, (flood stage 10 feet) and 22.7 feet on the Tioga River at Lindley, NY, (flood stage 17 feet) were the third highest of record. Crests along the Chenango River ranged up to about one foot over flood stage but flooding was severe enough to require the construction of an emergency dike in the Binghamton, NY, area. Serious flash flooding occurred along many of the smaller streams in the basin. Damage was extensive but far below that of the record Agnes flood of 1972. In the Pennsylvania portion of the basin preliminary estimates of losses were $241.6 million with no breakdown as to type of loss available. Five flood-related deaths were reported, nearly 20,000 people were evacuated, 2,000 National Guardsmen were activated, 51 water plants and 50 roads were affected, and 32 bridges were destroyed. In the New York State portion of the basin losses were estimated at $54.4 million, of which $23.5 million was agricultural, $13.1 million private property, and $17.8 million public property. The most seriously affected country was Chemung with losses of $32 million. Other counties affected were: Steuben, $11.3 million; Tioga, $5.3 million; Broome, $3.1 million; Madison, $2 million; and Allegheny, $700,000. Some losses were indicated in Chenango County, but no estimate is available. An estimated 3,500 people were evacuated and four flood-related deaths were reported.		
Potomac River Basin and Chesapeake Bay tributaries in Maryland	Major flooding developed in this area as a result of heavy rains associated with the remnants of hurricane Elosie augmented by surface waves accompanying an upper level trough which maintained the northerly flow of moisture-laden air. During the period of the 23d-27th storm totals of 6 to 9 inches were reported over the lower Potomac River Basin and most of northern Maryland with an 11-inch center over the Monocacy River Basin. The most severe river flooding occurred along the Monocacy River, which crested 15.8 feet over flood stage at Frederick, MD, where two water system pumping stations and a sewage treatment plant were closed. The Potomac River crested 5.5 feet over flood stage at Sheperdstown, WV; 8.4 feet over flood stage at Point of Rocks, MD, partially caused by heavy inflow from the Monocacy; and 3.4 feet over flood stage in the Washington, DC, area.	0	38,950

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	Severe flooding occurred along the Patapsco River with Ellicott City, MD, particularly hard hit. Urban and flash flooding of small streams caused substantial damage in Maryland, where total losses have been estimated at $24 million, of which $9 million was in Prince Georges County. Major damage was also reported in Carroll, Baltimore, Howard, Anne Arundel, and Montgomery Counties in Maryland with 2,600 families affected, 3,500 people evacuated, 78 dwellings and 63 businesses suffered major damage, and 1,650 dwellings sustained minor damage.		
	Severe urban flooding occurred in the District of Columbia with losses estimated at $3 million, of which $2.5 million was to Metropolitan Transit Authority construction sites.		
	Major flash flood damage occurred again along Four Mile Run in Arlington County and Alexandria in Northern Virginia. Losses to small businesses and residential garden apartments were estimated at $11.9 million, with about 1,500 people evacuated. Urban flooding caused losses of $50,000 in Occoquan, Loudoun County, VA.		
James River Basin (Virginia)	Monthly rainfall was well above normal over the basin with a new record total for September at Richmond of 10.98 inches. Other monthly totals ranged from less than 5 to more than 18 inches. This rainfall was spread out over the month so that no serious flooding developed. During the period of the 20th-26st amounts of 4 to 6 inches associated with the remnants of Eloise fell over the middle and lower portions of the basin including the Rivanna and Appomattox tributaries. Significant flooding occurred on the Rivanna River with a crest 6.5 feet over flood stage at Palmyra, and along the Appomattox River with crests ranging from 5 feet over flood stage at Farmville to 2 feet over flood stage downstream at Mattoaca. Flooding also occurred on portions of the James River at Bremo Bluff and at Richmond, where crests 4 to 5 feet over flood stage were reported.	0	N.A.
Atlantic Coastal Streams in North Carolina	Locally heavy showers occurred on the 1st over eastern portions of the district with amounts of 2.5 to 5 inches. Heavier rains fell again on the 12th and the 17-18th. On the 22d a combination of a frontal zone and the remnants of Hurricane Eloise caused four days of rainfall. Storm totals were generally 2 to 4 inches with up to 5 inches over the Piedmont and nearly 9 inches over south coastal areas. Some generally minor flooding resulted on several streams. Crests of 1 to 2.5 feet over flood stage occurred along the Neuse, Rocky, and Lumber River. About 5 feet of flooding was reported along the middle reach of the Cape Fear River.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

SEPTEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
Atlantic Coastal Streams in South Carolina	Severe flash flooding struck two areas of South Carolina during September. They were Greenville County, SC, especially the Reedy River Basin, and the city of Rock Hill, SC. About 90% of the substantial damage for the month occurred in these two areas. Elsewhere significant flooding occurred along the Pee Dee River in northeastern South Carolina. Minor flooding occurred along the upper Saluda River and lower Broad River as well as along the Congaree River below Columbia, SC.	1	908

Rainfall was generally heaviest in the 24 hours ending at 7 a.m. on the 18th and with the passing effect of Hurricane Eloise in the 48 hours ending at 7 a.m. on the 24th. A striking feature of the heavy rainfall the night of the 17th and early morning of the 18th was the line of convergence extending from south to north from Calhoun Falls, SC to Antreville, SC, Pelzer, SC, Greenville, SC, Hogback Mountain, SC, Tryon, NC, to Lake Lure, NC. Converging southwest and southeast winds aloft over a wedge of cooler air produced this heavy rainfall. Amounts of rainfall averaged 5.5 to 6 inches along this line. A trough aloft with surface low moving northeast from Mobile, AL, triggered this rainfall. The rainfall caused by remains of Hurricane Eloise was less spectacular with 2.5 to 4 inches over higher elevations within 48 hours.

Monthly rainfall ranged from 17 to 19 inches over the small mountainous area of South Carolina to 10 to 12 inches over the upper Piedmont. The lower Piedmont received 5 to 7 inches. An area of light rainfall over south central South Carolina received an average of only 3 to 5 inches.

The Greenville, SC, Duke Power Station, near the Hudson Street staff gage, recorded 5.84 inches of rainfall in the 24 hours ending at 7 a.m. on the 18th. In the same time period the Traveler's Rest automatic gage recorded 4.5 inches rainfall, and the Hunts Bridge observer, 3.24 inches. Flooding of streets and roads occurred in the city of Greenville, SC, and also Greenville County. Reedy River crested at Hudson Street at 15.0 feet at about 6:30 a.m. on the 18th. This was 6 feet over flood stage and the highest flood crest since the 15.6 feet crest on March 6, 1963. In an outlying area south of Greenville (not Reedy River Basin), a child drowned when a car plunged in a deep washout in a road. A lake dam had burst upstream. Heavy property damage occurred at Westfield Bridge, site of the telemark gage. The crest is estimated to have reached a gage reading of about 13.5 feet. Reedy River stayed within banks at Westfield Bridge, but overflow over the right bank upstream came down railroad tracks parallel to the stream bed causing extensive damage in the Citizens Building Mart Warehouse. Evac-

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)

ATLANTIC SLOPE DRAINAGE-Cont'd

uation of some residents, especially along Richland Creek, was necessary. Minor flooding occurred again on the 23d, when the stage of the Reedy River at Greenville reached 10 feet. About 75% of the Greenville County losses occurred along Reedy River and its main tributaries, Langston Creek and Richland Creek. The Bleachery at intersection of Old Buncombe Road and Highway 253 suffered a loss of $500,000. Total losses for Greenville County were estimated at $743,500.

In the Catawba-Wateree Basin, Lake Norman, largest reservoir in this system, and Lake Wylie were able to protect downstream reservoirs from flooding by storage of heavy inflow during the third week. Remains of Hurricane Eloise went up the west side of the Appalachians, removing a dangerous flood threat. A cloudburst occurred over the city of Rock Hill, SC between about 6 and 10 p.m. on the 22d. Winthrop College, in the center of Rock Hill, recorded 3.61 inches of rainfall in 2 3/4 hours and 4 inches in four hours. A few miles to the northwest, Fort Mill, SC, (Lake Wylie Dam) recorded 4.64 inches within 24 hours, with the bulk of it during the evening of the 22d. On the northeast edge of Rock Hill, the Celanese Corporation observer recorded 2 inches of rainfall from 6 p.m. to 8 p.m. on the 22d and 3.30 inches of rainfall by 11:30 p.m. with a 24-hour amount of 3.87 inches. Severe flash flooding resulted with about 300 people forced from homes, apartments, etc. Within 2 hours after the end of heavy rainfall, all except 5 families were able to return home as flood waters rapidly receded to bankfull stages. Damage estimates in a thorough Civil Defense report are estimated at $140,000 by E. F. Stutts, Director. The rapid and efficient reaction to this severe flooding by Civil Defense, city employees, and the Rescue Squad was one of the finest seen in South Carolina this year.

In the Pee Dee Basin heavy rainfall of about 10 inches within a week at Cheraw, SC, gave a crest there of 31.6 feet on the 25th. Flood stage is 30 feet. Downstream at Pee Dee, SC, flood stage of 19 feet was reached on the 26th. The crest there of 21.2 feet occurred on the 29th, and flooding continued at the end of the month. Losses were estimated at $25,000, mainly agricultural.

In the Broad River Basin heavy rainfall of 4 to 6 inches occurred over the headwaters in the 24 hours, ending at 7 a.m. on the 18th. Downstream rainfall was much less and the crest at Gaffney on the 19th was 8 feet, which lacked 1.5 feet of reaching flood stage. Downstream at Blair, SC the crest on the 21st reached 13.8 feet, lacking 0.2 feet of reaching flood stage. Additional heavy rainfall of 2.5 inches over the headwaters on the 23d-24th resulted in a crest 1.1 feet over

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

SEPTEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	flood stage the evening of the 25th at Blair. In the Saluda River Basin rainfall of 2.5 inches over the headwaters and 5.35 inches at Pelzer, SC, within 24 hours gave a crest of 10 feet at Pelzer on the 18th. Flood stage is 9 feet. Lake Greenwood successfully handled flood inflow by storage and generation.		
	EAST GULF OF MEXICO DRAINAGE		
Northwest Florida and Alabama Streams	September was a normal month for rainfall and river fluctuations were normal up until the time Hurricane Eloise moved inland near Fort Walton Beach, FL, and continued north through eastern Alabama. The rapid movement of the storm prevented major flooding in Alabama and northwest Florida. However, extensive lowland flooding occurred in northwest Florida while in Alabama some rivers rose to near flood stage. Heaviest rains fell just north of Montgomery, AL, where almost 7 inches was recorded in a 30-hour period. Rainfall elsewhere in southern Alabama and northwest Florida totaled 4 to 6 inches with some locally higher amounts. On the Coosa River, Lake Logan Martin reached 467.2 feet on the 25th, 2.2 feet above flood stage. The Yellow River crested 2.3 feet above flood stage at Milligan, FL on the 26th. Residents were evacuated and some homes were flooded in the old Milligan area. Further downstream at Millers Bluff the river was 10 feet above normal, but sparse population below Milligan kept damage to a minimum. Lowland flooding occurred along the Blackwater, Shoals, and Escambia Rivers but no reporting stations went over flood stage. The lower Alabama and Choctawhatchee Rivers crested just below flood stage at Claiborne, AL, and Caryville, FL, respectively. The monthly mean flow of the Shoals River at Crestview, FL, of 3,990 c.f.s. was reported by the U. S. Geological Survey to be the highest for September since records began in 1938.	0	N.A.
	UPPER MISSISSIPPI BASIN		
Chippewa River Basin	Rural flooding occurred along Bear Creek near Durand, WI, on the 11th in response to highly localized heavy rain in the area. Durand reported 7.55 inches for the storm. No reporting stations went over flood stage. The resultant rise on the Chippewa River was 3.2 feet.	0	N.A.
	MISSOURI BASIN		
James River	Rural flooding on the James River around Stratford, SD, which had been in progress since late May, ended on the 7th.		

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

SEPTEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
Kansas River Basin	Flash flooding was reported in the vicinity of Russell, KS, on the 5th, caused by rains in excess of 2.5 inches with an unofficial report of 7.25 inches near Dorrance, KS. From 12 to 18 inches of water were reported over both lanes of Interstate 70, the Union Pacific Railroad, and old U. S. 40, all of which were closed to traffic for a few hours. On the 10th-11th thunderstorms produced 2.5 to 3 inches of rain over northeast Kansas causing rises on small streams in the area. Stranger Creek crested about 1.5 feet over flood stage at Easton, KS.	0	N.A.
Lower Missouri River tributaries	Locally heavy rains occurred on three occasions over portions of the area with monthly totals of 6 to 9.5 inches over some areas. On the 11th-12th amounts in excess of 3.5 inches caused some flooding on streams in west central Missouri. The Little Blue River crested 5 feet over flood stage at Lake City, the Blackwater River crested 4.5 feet over flood stage at Valley City, and 1.5 feet of flooding occurred on the Lamine River at Clifton City.	0	N.A.
Missouri River Main Stem	Flooding at Williston, ND, which began early in June from high pool elevations behind Garrison Dam ended about the 1st. Above normal releases from upstream reservoirs continued to cause lowland flooding from Ponca to Rulo, ND, during the month. On the 4th-5th rains of up to 6.5 inches over northwest Missouri caused the Missouri River to slightly exceed flood stage at St. Joseph, MO.	0	N.A.
	OHIO RIVER BASIN		
Middle Ohio River Basin	No river flooding occurred during September; however, small stream flooding was reported in the New River Basin from rains of 3 to 4.5 inches on the 17th-19th, and again on the 22d-24th from rains of 4 to 5 inches associated with the remnants of Hurricane Eloise. A small child drowned in the Meadows River near Rupert, WV, during the latter event. Rainfall amounts up to 4 inches caused minor flash flooding over portions of South Central, Central and Northeast Kentucky on the 23d-24th.	1	N.A.
Tennessee River Basin	Rainfall associated with hurricane Eloise amounted to 4-5 inches over the upper portion of the basin with the upper French Broad River and South Chickamauga Creek going over flood stage. Crests of 1 to 2 feet over flood stage were reported on the upper French Broad and a crest 5.6 feet over flood stage occurred at Chickamauga, TN.	0	N.A.
Ohio River Main Stem	Rains from Hurricane Eloise caused a pronounced rise along the Ohio River. Stages rose more than 18 feet just above Cincinnati, OH, and 5	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

SEPTEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO RIVER BASIN-Cont'd		
	feet at Louisville, where some small boats were lost. The lower Ohio crested about three-quarters bankfull by the end of the month.		
	WHITE BASIN		
Cache River	Flooding continued from August on the Cache River, which fluctuated above flood stage the entire month. A secondary crest 1.2 feet over flood stage occurred at Patterson, AR, on the 22d. Rainfall in excess of one inch was reported on the 13th and 20th.	0	N.A.
	ARKANSAS BASIN		
Pryor Creek	An intense slow moving thunderstorm deposited 8.56 inches of rain on Pryor, OK, during the 24-hour period ending at 7 a.m. on the 19th. The average rainfall over the surrounding area of about 90 square miles for this period was 5.9 inches. More than 30 homes suffered water damage from Pryor Creek. No stage reports are received from this stream.	0	300
Illinois River	Rainfall was well above normal during September over the headwaters of the Illinois River in northwest Arkansas. Huntsville, AR, just over the divide, had a monthly total of 11.46 inches, of which 5 inches fell in a 24-hour period. The Illinois crested 3.3 feet over flood stage at Tallequah, OK, on the 21st.	0	N.A.
	WEST GULF OF MEXICO DRAINAGE		
Rio Grande Basin	Tropical storm Caroline produced the first heavy rains over the lower Rio Grande Valley in over a year. Severe urban flooding occurred in Raymondville, TX, where a total of 11.09 inches of rain fell during the period August 30 to September 2. Residential damage occurred in 50 blocks of the city. Elsewhere in the United States portion of the basin amounts of 3 to 6 inches were reported. However, rainfall was much heavier on the Mexican side of the river. The runoff from this storm caused a strong rise on the lower Rio Grande which lasted through the end of the month with a crest about 2 feet below flood stage at Mercedes and Brackettville, TX, on the 18th. The river failed to go over flood stage due to operation of the flood bypass by the International Boundary Commission. Serious flooding also occurred in parts of New Mexico. Numerous homes and several major roads were flooded around Belen, NM, as the city received its greatest September rainfall since 1928. During the period of the 3d-13th, 4.36 inches were recorded at Belen. Urban flooding	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	WEST GULF OF MEXICO DRAINAGE-Cont'd		
	was reported in Santa Fe with residential damage.		
	GREAT BASIN		
Nevada	On the 8th-9th flash flooding was reported in the Tonopah area and east of Reno with Interstate 80 closed in the Fernley and Wadsworth areas. Urban flooding occurred in Reno with streets closed and garages flooded in the southwest part of the city.	0	N.A.
Mojave Desert and Owens Valley areas	Flash flooding occurred in a number of areas in Inyo, Mono, and San Bernardino Counties of California on the 10th. In this sparsely populated area the principal effect was the inundation of several major highways. These included: Highway 136 east of Lone Pine; Highway 127 east of Death Valley Junction; Highway 190 from Death Valley Junction to Furnace Creek Junction; Highway 14 between Mojave and Red Rock Canyon; and the Lenwood off-ramp from Interstate 15. A number of secondary roads in Owens Valley were also affected. A woman was killed when an 8 foot wall of water knocked her car off of Highway 14 into Red Rock Canyon.	1	N.A.
	GULF OF CALIFORNIA DRAINAGE		
Colorado River Basin in Nevada	Flash flooding occurred in Las Vegas on the 16th. A 14-year old boy was drowned in a culvert. A construction site was flooded and mud was deposited on the airport runway and on some streets and sidewalks.	1	N.A.
Little Colorado River Basin	Extensive flooding occurred in Gallup, NM, on the 8th from the Rio Puerco and a flash flood damaged 8 homes along the Zuni Canyon Road in nearby Zuni. No stage or rainfall data is available.	0	N.A.
Gila River Basin	Heavy rains over the headwaters of the basin on the 8th-9th caused flooding along the Blue and San Francisco Rivers and flash flooding in Safford, AZ. The crest of the San Francisco River was estimated to be 2.5 feet over flood stage at Clifton, AZ. Damage in Greenlee and Graham Counties was estimated at $91,000 to public property and $275,000 to private. Urban flooding was reported in the Green Valley area on the 1st and 4th and the Tucson area on the 13th.	0	367
Lower Colorado River	Flash flooding was reported in several communities along the river during September. These included Parker, AZ, on the 8th and Topcock, AZ, and Needles, CA, on the 17th.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

SEPTEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ALASKA		
Susitna, Kenai, and Copper River Basins	Urban flooding occurred in Anchorage on the 4th resulting from widespread heavy rains which caused bankfull stages on small streams from the Kenai to the Copper River. More than 1.7 inches in 24 hours was reported in Anchorage with some basement flooding and damage to streets under construction. Additional heavy rains on the 18th and 22d caused some streams in the same areas to reach near bankfull stages. Willow Creek on the Parks Highway reached a stage of 7.5 feet (Flood stage 7 feet), causing damage to a commercial camper facility.	0	N.A.
	PUERTO RICO-VIRGIN ISLANDS		
	A tropical depression, first detected by ship reports on the 11th, moved along a west to west-northwest track until by late afternoon of the 14th its center was just north of the Leeward Islands. Most of the rain associated with this disturbance was located mainly to the east and south of the center. As the storm continued westward the heavy rain area also spread westward across the Leewards and Virgin Islands. St. Kitts reported 4.12 inches in 24 hours. St. Martin reported a total of 9.88 inches.		
Virgin Islands	This depression intensified to tropical storm Eloise passing about 25 miles north of St. Thomas/St. John around noon on the 15th. Two-day totals for the 15th and 16th averaged generally 3 to 5 inches on these islands with no serious flooding from runoff reported. There are no streams and rivers on either of these two islands. At St. Croix, however, rainfall was generally heavier and ranged from a little over 4 to a little over 9 inches for the two days. The heavier rains fell along the northern and eastern portions of the island and sandbagging of some streams was necessary. A number of roads were impassable or in some cases completely inundated. Only minor damage was reported and in general the rains were quite beneficial, coming at a time of long term meteorological drought when most home cisterns were nearly empty. In some cases people had already run out of water and were buying it at rather high prices.	0	Minor
Puerto Rico	Puerto Rico suffered some of its heaviest flooding in recent years, especially in the southwestern sections. The first heavy rains began early in the morning on the 15th in the eastern portions and moved into the western area by early afternoon. By late evening most island rivers were swollen and continuing to rise. High intensity rains began over the Eastern Cordilleras on the next morning with the Pico del Este recording gage showing 4 inches during the hour ending at 2 a.m. About six hours later the Western Cordilleras began to receive this same heavy rain, and 3.7 inches in one hour ending at 9 a.m. was reported	34	60,000

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)

PUERTO RICO-VIRGIN ISLANDS-Cont'd

Adjuntas. Major flooding occurred on 21 rivers on the 16th, mostly concentrated in the western portions. Over 26 inches of rain was recorded over the southwestern slopes near Sabana Grande during the three day period of the 15th-17th. The most serious flooding occurred on the Culebinas, Anasco, Guanajibo, Rosario, Loco, Guayanilla, Bucana, Cerillos, Tallaboa, Portugues, and Patillas Rivers; all in the south and western portions of the island, and Rio Grande de Arecibo in the western interior.

The crest stages on the Tallaboa, Guayanilla, Anasco and Culebrinas Rivers were estimated by the U. S. Geological Survey to have a frequency greater than 100 years and crest stages on the Patillas, Cerrillos, Bucana, Portuguese, Guayanilla, Anasco and Culebrinas Rivers were the highest observed in 10 to 15 years of records on these streams. In addition to the 34 known dead, more than 275 people were injured, and more than 10,000 people were left homeless from this flooding.

NO DATA RECEIVED

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the form [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA".

Units: Milli-atmo-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Monthly

REFERENCE NOTES

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES: Dates in the table apply to the period 24 hours prior to time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. (See individual Climatological Data for times of observations).

+	And also on an earlier date or dates.
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

B	Number of days maximum 21.1°C. or above for Alaskan Stations.
Y	Peak Gust.
+	And also on an earlier date or dates.
U	Indicates Urban site.
R	Indicates Rural site.
Ø	Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
°F. = $\frac{9}{5}$ x C + 32
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

STORM SUMMARY:

°	Includes crop damage.
C	Crop damage.
*	No occurrence of storms or unusual weather phenomena reported.
@	Includes heavy sleet storm.
#	Freezing drizzle and freezing rain, commonly known as glaze.
Ø	For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
‡	No Storm Data Report received for this State.
<>	Report Incomplete.
†	Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5 Million
7	$5 Million to $50 Million
8	$50 Million to $500 Million
9	$500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

1/	Flooding continued at the end of the month.
NA	Not available.

FLOOD STAGE DATA:

#	Highest Stage Observed
1/	Continued at end of month
___	Highest Stage of Record
E	Estimated
P	Provisional (Flood Stage)
U	Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

*	Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
+	Observations for these stations are scheduled at 0000 G.C.T.
†	Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

REFERENCE NOTES

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

()	Clouds Present	DM	Moderate Dust	HM	Moderate Haze	KS	Slight Smoke
*	Values corresponding to true solar noon	DS	Slight Dust	HS	Slight Haze	M	Moderate Haze-indeterminable
BD	Blowing Dust	F	Fog	I	Intense Haze-indeterminable	N	Sand
BN	Blowing Sand	GF	Ground Fog	K	Smoke	S	Slight Haze-indeterminable
D	Dust	H	Haze	KI	Intense Smoke		
DI	Intense Dust	HI	Intense Haze	KM	Moderate Smoke		

SOLAR RADIATION TOTALS: Langley is the unit used to denote one gram calorie per square centimeter.

* Values with an asterisk are interpolated.

Data are only for those stations equipped with Eppley Model II sensors.

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega\Omega\Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

OCTOBER 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

r precipitation was generally extreme--either lly dry or unusally wet. Rainfall was less 0% of normal from the Great Lakes southwest- cross the western Corn Belt, the central and rn Great Plains, and the desert Southwest.

lly wet conditions were experienced in the est, from the Ohio Valley to the Gulf Coast, er much of New England. Over 20 inches of ell along the Washington coast while parts of uthern Great Plains received less than 0.1 Rainfall in the Atlantic Coast States and n Gulf Coast area was generally near normal.

atures averaged near normal during October ost of the country. Areas with average atures 2° or more above normal were limited to eat Plains States and the Atlantic Coastal , including central Florida. Colder than nor- ckets of air were limited to the Mountain .

r began with cold air and clear skies west of ssissippi and general rains in the East. By skies had cleared to the Atlantic Coast; for xt 4 days the only significant precipitation Nation was confined to parts of Alabama, a, and Florida. However, the cool dry air, ed with clear skies, produced record low atures across a broad area. On the 3d Little AR, sank to a record 41° and Pittsburgh, PA, ew low of 31°. San Antonio, TX, reported 44° 5th. Freezing temperatures, however, had impact on northern grain areas, where most already were mature.

infall activity in the Southeast began to northward on the 7th, covering most areas f the Mississippi by the 9th. Also the first major winter storm of the season swept into the intermountain region on the 7th.

Winds gusted to 65 m.p.h. in parts of California, Arizona, and Utah. By the 9th snow had moved into North Dakota, where Minot measured 2 inches of predawn snow.

Warm air and sunshine began pushing the thermometer skyward in the Nation's midsection from the 10th-12th. Temperatures reached into the 90's as far north as Kansas, Nebraska, Iowa, and Tennessee. Sioux City, IA reached 92° on the 12th--breaking the record set in 1899.

A cold front out of the Rockies and a tropical depression from the Gulf controlled the weather picture from the 14th to the 19th. Drifting eastward, the front dropped temperatures into the freezing range across the northern and central Plains and middle Mississippi Valley. Ahead of the front, though, record-breaking highs ranged from the Gulf Coast to the Great Lakes and middle Atlantic States. Responsible for much of the rain in the eastern third of the Nation, the slow moving Gulf depression spread heavy amounts from the lower Mississippi Valley along the Appalachians into the New England States over a 4 to 5 day period.

Heavy rains in the Northeast caused landslides and washouts that closed roads in New Hampshire and Vermont before the storm moved offshore on the 21st.

A major winter storm blanketed the northern Rockies with snow on the 22d-24th. Lander, WY, reported 9 inches on the ground and higher elevations measured even greater depths. In contrast, the eastern third of the Nation basked under summer-like temperatures that soared to record levels at many locations. The final 5 days of October were generally warm and dry, especially in the Plains region.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

OCTOBER 1975

Herbert J. Thompson, Office of Hydrology

Major flooding occurred in Tennessee during October with losses estimated at $10 million in the middle and lower Cumberland and Tennessee River Basins. Serious flooding also occurred in Mississippi with loss of one life and losses approaching $2 million in the Pearl and upper Tombigbee River Basins.

This flooding was associated with a storm system which moved northeastward during the period of the 15th to the 20th which also caused substantial lowland flooding in the Ohio River Basin in Kentucky and minor to moderate river and flash flooding on a number of streams along the Atlantic Coast from Florida into New England. Some flooding continued from September on several streams in the Middle Atlantic coastal area.

Extremely heavy rainfall occurred in the Pacific Northwest with relatively minor flooding on the Wilson River in Oregon and the Nooksack River in Washington.

These and other hydrologic events of unusual significance or involving loss of life or property damage are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE		
Connecticut River Basin	The storm of the 19th-20th caused general heavy rainfall over the Connecticut River Basin with amounts in excess of 3 inches over the lower portion of the Basin. A substantial rise occurred along the length of the river with 3 to 4 feet of flooding from above Hartford, CT downstream. Some flash flooding was associated with this storm.	0	N.A.
Hudson River Basin	Considerable flash flooding occurred on smaller streams of the middle and lower Mohawk River Basin on the 19th-20th. Rainfall of up to over an inch the 17th to 18th saturated the soil and was followed by amounts of 2 to 3.5 inches on the 19th-20th, most of which ran off. Schoharie Creek crested just below flood stage while the Mohawk River crested 2 to 3 feet below flood stage.	0	N.A.
New Jersey Coastal and Delaware River Basins	Rainfall was about 150 percent of normal over the area during October. A tropical depression and an extra-tropical cyclone combined into one system over western Pennsylvania to bring rain in excess of 2 inches to the area during the 17th-18th with the heaviest amounts over the headwaters of the Delaware River. Both the East and West Branches of the Delaware were reported to have exceeded flood stage but the gage was out order and no crest data is available. In New Jersey the upper Millstone River had a crest 1.8 feet over flood stage on the 19th at Blackwells Mills.	0	N.A.
Susquehanna River Basin	The storm of the 17th-18th, mentioned above, also deposited heavy amounts of rain over the upper Susquehanna River, which exceeded flood stage by about 3 feet above Binghamton, NY, and by about one foot downstream at Vestal, NY. The Middle Susquehanna Basin received amounts of 3 to 4 inches from this storm with	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	some smaller streams reaching bankfull level, while the main stem crested about three quarters bankfull.		
South Atlantic Coastal Streams	Light flooding from the heavy rains of late September associated with hurricane Eloise continued into early October on the Neuse River at Goldsboro, NC. The Lumber River at Lumberton, NC, crested 1.8 feet over flood stage on the 1st, and the Pee Dee River flooded lightly at Pee Dee, SC. Minor flooding also occurred on the Roanoke River at Williamston, NC, from the 1st to the 12th as a result of upstream reservoir releases. The most significant flooding during the month resulted from a low pressure center, the remains of a tropical depression, which deposited rainfall amounts of 3 to 7 inches over the headwater areas of various streams as it moved across the area from eastern Tennessee. Flash flooding from this heavy rainfall caused losses estimated at $5,000. The Yadkin River crested 4.7 feet over flood stage at Elkin, NC, and the Broad River 6.4 feet over flood stage at Blair, SC. Some flooding also occurred along the Reedy River. Locally heavy amounts of over 3 inches on the 9th caused minor flooding on the Lumber River. Minor flooding began on the lower Savannah River on the 28th which continued into November.	0	N.A.
	EAST GULF OF MEXICO DRAINAGE		
Apalachicola and Choctawhatchee Rivers	Two periods of relatively minor flooding occurred on these streams during October. Rainfall during the period of the 6th to the 9th amounted to up to 3 inches or more in the headwaters of the Apalachicola, which crested 2 feet over flood stage at Blountstown, FL, on the 10th. Minor flooding occurred on the Choctawhatches at Caryville, FL. Rains of more than 3 inches on the 17th-18th caused minor flooding on the lower Apalachicola and a crest 1.6 feet over flood stage on the Choctawhatchee at Caryville.	0	N.A.
Tombigbee River Basin	The storm of the 17th-18th deposited amounts of up to more than 6 inches over the headwaters of the Tombigbee. Local flash flooding occurred in many areas. Crests of 1.8 feet and 2.9 feet over flood stage were reported at Fulton, MS, and Amory, MS, respectively. Loss estimated by the Corps of Engineers was $278,000 on the East Fork and $695,000 on the Noxubee River. Much of this loss was apparently caused by flash flooding, since the crest on the East Fork was not particularly high and the Noxubee River was not reported over flood stage. The loss was	0	973

OCTOBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	EAST GULF OF MEXICO DRAINAGE-Cont'd		
	primarily agricultural. Minor flooding occurred on the lower Tombigbee a few days later from this storm.		
Pascagoula and Pearl River Basins	A record October twenty-four hour rainfall amount of 7.03 inches was reported at Jackson, MS, on the 15th to the 16th. Severe urban and flash flooding resulted in the area with some evacuations necessary. A 13-year old girl was swept off a bridge and drowned. About 25 people were evacuated from their homes in Pearl, MS. The Pearl River crested 13 feet over flood stage at Jackson and about 5 feet of flooding occurred upstream. This storm caused flooding on the Lower Pearl River in Louisiana which continued into November. Monthly rainfall totals were more than 300 percent of normal over the upper pearl Basin. Losses estimated by the Corps of Engineers included $760,000 agricultural, $164,000 to roads and railroads, and $5,000 urban. Urban flooding in Pascagoula, MS, caused evacuation of numerous families.	1	930
	MISSOURI BASIN		
Missouri River	October was an unusually dry month over much of the basin with only traces of precipitation reported at several stations in Iowa and Missouri and many stations in central and western Kansas reported none. The abnormally high releases from upstream reservoirs continued throughout the month resulting in high stages downstream and lowland flooding in the Ponca to Rulo, NE reach.	0	N.A.
	OHIO BASIN		
Ohio River Tributaries in Kentucky	Rainfall of 3 to 4 inches associated with the storm of the 17th-18th caused substantial lowland flooding along the Barren, Ohio, and lower Salt and Green Rivers in Kentucky. Up to 30,000 acres of cropland were affected with heavy losses of corn and soybeans. These rivers crested just below flood stage at the reporting stations upstream.	0	N.A.
Cumberland and Tennessee River Basins	The storm of the 17th-18th caused serious river and flash flooding in the middle section of Tennessee where rainfall averaged about 4 inches with locally heavy amounts to 6 inches. Moderate flooding occurred on the upper French Broad River in North Carolina with similar amounts of rainfall. In the Cumberland River Basin the Harpeth River crested nearly 4 feet over flood stage at Kingston Springs, TN. In the Tennessee River Basin minor flooding occurred on South Chickamauga Creek while crests of up to nearly 6 feet over flood stage	0	10,000

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

OCTOBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Cont'd		
	were reported on the Duck River and 4 to 5 feet over flood stage on the Elk River. The Tennessee River went slightly over flood stage at Florence, AL. In the headwaters of the Tennessee a crest of 4.2 feet over flood stage occurred on the French Broad River at Rosman, NC. Over 20,000 acres of corn and soybeans were inundated in middle Tennessee with crop loss estimated at $3 million. Extensive loss also occurred to pastures, bridges, homes, and machinery and farm equipment.		
	LOWER MISSISSIPPI BASIN		
Big Black River Basin	The storm of the 15th-16th produced heavy rainfall with amounts of over 6 inches common. Significant lowland flooding occurred along the Big Black River with crests 6 to 7 feet over flood stage. Flash flooding from Bear Creek caused damage to 200 homes in Canton, MS, with residents evacuated. Urban flooding caused evacuation of 25 people in Vicksburg, MS.	0	N.A.
	WEST GULF OF MEXICO DRAINAGE		
Calcasieu River	Monthly rainfall for October was well above normal over the headwaters of the Calcasieu River, with a total of almost 9 inches at Hineston, LA. The river was above flood stage there from the 26th into November with a crest 3.3 feet over flood stage on the 28th.	0	N.A.
Southeast Texas Streams	Soil conditions in the area during the first half of October were the driest in about four years. Stages on some streams were the lowest since 1972. On the 15th-16th rains of 1 to 3 inches occurred, and amounts of 3.5 to 5 inches fell on the 23d-26th causing several streams to approach or exceed bankfull stages at some points. Village Creek crested at 14.65 feet at Kountze where the bankfull-flood stage is 12 feet. Pine Island Bayou crested at 24.98 feet at Sour Lake, just short of the 25 feet flood stage and well above the bankfull stage of 22 feet. Both streams are in the lower Neches Basin. Strong rises occurred on the lower Neches and Sabine Rivers.	0	N.A.
	PACIFIC SLOPE DRAINAGE		
Oregon Coastal and Willamette Valley Streams	The wettest October since 1962 occurred in the north coastal area with monthly totals of 7 to 19 inches and the Willamette Valley with totals of 4 to 11 inches of rain. More than half of these totals occurred during the period of the 25th-30th when Tillamook 13 ENE recorded 10.06 inches and Nehalem 9	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

OCTOBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE-Cont'd		
	NE recorded 9.13 inches. Sharp rises occurred on the Wilson and Nehalem Rivers with the Wilson River cresting slightly over flood state on the 30th. Minor agricultural damage was reported along the Wilson River.		
Coastal Streams in Washington	Heavy rainfall over extreme northwest Washington during the period of the 14th-18th caused flooding on the Nooksack River with a crest about one foot over flood stage on the 18th. More than 8 inches of rain was reported at a nearby Canadian station for the period, with over 4 inches on the 17th.	0	N.A.
	PUERTO RICO		
	Two periods of heavy rainfall during October caused some urban flooding. On the 11th heavy rains occurred over the southwestern and western portions of the island with one station recording a 24-hour total of 5.75 inches. On the 23d rains of 3 to 4 inches were reported over the southern central slopes, and most of the rivers between Ponce and Maunabo were running near bankfull. However, no river flooding was reported.	0	N.A.

NO DATA RECEIVED

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms.

Station	Day of month																															Mean O_3
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

REFERENCE NOTES

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES: Dates in this table apply to the ending 24-hour period prior to time of observation. In some cases the actual occurrence is on the calendar date [illegible] of observations.

- + And also on an earlier date or dates.
- D Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

- B Number of days maximum 21.1°C. or above for Alaskan Stations.
- Y Peak Gust.
- + And also on an earlier date or dates.
- U Indicates Urban site.
- R Indicates Rural site.
- Ø Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
$F. = \frac{9}{5} C + 32$
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

- U Indicates Urban site.
- R Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

- U Indicates Urban site.
- R Indicates Rural site.

STORM SUMMARY:

- ° Includes crop damage.
- C Crop damage.
- * No occurrence of storms or unusual weather phenomena reported.
- @ Includes heavy sleet storm.
- # Freezing drizzle and freezing rain, commonly known as glaze.
- Ø For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
- ‡ No Storm Data Report received for this State.
- <> Report Incomplete.
- † Storm damages are placed in categories varying from 1 to 9 as follows:
  - 1 Less than $50
  - 2 $50 to $500
  - 3 $500 to $5,000
  - 4 $5,000 to $50,000
  - 5 $50,000 to $500,000
  - 6 $500,000 to $5 Million
  - 7 $5 Million to $50 Million
  - 8 $50 Million to $500 Million
  - 9 $500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

- 1/ Flooding continued at the end of the month.
- NA Not available.

FLOOD STAGE DATA:

- # Highest Stage Observed
- 1/ Continued at end of month
- ___ Highest Stage of Record
- E Estimated
- P Provisional (Flood Stage)
- U Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

- * Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
- + Observations for these stations are scheduled at 0000 G.C.T.
- † Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

REFERENCE NOTES

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

()	Clouds Present
*	Values corresponding to true solar noon
BD	Blowing Dust
BN	Blowing Sand
D	Dust
DI	Intense Dust
DM	Moderate Dust
DS	Slight Dust
F	Fog
GF	Ground Fog
H	Haze
HI	Intense Haze
HM	Moderate Haze
HS	Slight Haze
I	Intense Haze-indeterminable
K	Smoke
KI	Intense Smoke
KM	Moderate Smoke
KS	Slight Smoke
M	Moderate Haze-indeterminable
N	Sand
S	Slight Haze-indeterminable

SOLAR RADIATION TOTALS: Langley is the unit used to denote one gram calorie per square centimeter.

* Values with an asterisk are interpolated.
Data are only for those stations equipped with Eppley Model II sensors.

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega \Omega \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

NOVEMBER 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

Extreme dryness in parts of the Great Plains was relieved by abundant November moisture that at times occurred as blinding blizzards. In general, precipitation across the Nation was greater than normal. Major exceptions were the Far West, most of Texas, and the Southern Atlantic Coast. Rainfall amounts ranged from a trace at Las Vegas to over 24 inches at Quillayute, WA. Temperatures in the northeast quadrant were well above normal.

November began with fair skies across most of the Nation except for very welcome moisture in the central Great Plains. Rainfall activity spread across the eastern United States on the 2d, accompanied by record warmth that continued most of the week. Weekly temperatures averaged 12 to 20° above normal. Heaviest rainfall amounts were associated with strong thundershower activity in Louisiana. Over 8 inches in New Orleans on the 5th caused some serious flooding. Colder air pushed across the Rockies on the 8th and triggered some tornado activity in northeast Iowa on the 9th.

Temperatures averaged near normal from the 10th to the 16th, when very warm conditions early in the week turned quite cold. Freezing temperatures moved into northern Florida the morning of the 15th. Heaviest precipitation occurred across the Southeast and along the northern edge of the Pacific Coast. At midweek, wintry weather dropped as much as 9 inches of snow in the western Great Lakes area. Showers and thundershowers were widespread from the Ohio Valley to the Louisiana Delta.

A severe winter storm began building up over the central Rockies on the 17th. The storm dumped heavy snow across the Rockies and moved into the Great Plains on the 18th. Whipped by 40 m.p.h. winds, blizzard conditions spread from eastern Colorado to the Great Lakes by the 20th. Heaviest snow occurred from eastern Nebraska into northern Minnesota. Snow closed roads throughout the area with zero visibilities, high winds, and huge drifts. As skies cleared, unseasonably cold air covered most of the Nation.

Unseasonably cold temperatures put most of the Nation in the grip of winter during the closing week of November. Temperatures averaged 6 to 24° below normal over the Rockies and Great Plains. Winter storms blanketed parts of the Rockies and Great Plains with snow as far south as the Texas Panhandle on the 25th.

Widespread storms on the 26th forced some holiday travelers to change their plans. One storm drifted across the middle Mississippi Valley and a second moved into the Plains from the northern Rockies. Hazardous travel conditions existed in portions of the Plains and the upper two-thirds of the Mississippi Valley. Snow spread into New England on Thanksgiving Day. The month ended with extremely cold conditions in many parts of the country.

In general, November weather favored agriculture. Row crop harvests of corn and soybeans were completed well ahead of normal and farmers made excellent progress in preparing fields for next year. Moisture during the month relieved very dry conditions in the Great Plains. Citrus crops that matured faster than usual benefitted from cooler temperatures later in the month.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

NOVEMBER 1975

Herbert J. Thompson, Office of Hydrology

There was no serious river flooding during November. However, severe urban flooding was reported in several areas. These included Birmingham, Mobile, and Baldwin County, AL, New Orleans, LA, and San Juan, Puerto Rico.

Minor lowland flooding continued from October on the lower Savannah River in Georgia, the lower Pearl and upper Calcasieu Rivers in Louisiana, and along the Missouri River in Nebraska.

Some minor to moderate flooding occurred in scattered areas of the country during the month. Streams affected were the Assunpink River in New Jersey, the Neuse, lower Congaraee and Savannah Rivers in the Southeast, the lower Pearl River in Louisiana, Cedar Creek in Iowa, Stranger Creek in Kansas, the Big Black River in Mississippi, the lower Trinity River in Texas, and several streams in the north Pacific coastal area. Ice jam flooding was reported along Willow Creek in Alaska.

These and other hydrologic events of unusual significance or involving loss of life or property damage are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE		
New Jersey Streams	November streamflow was above normal for the seventh consecutive month and was excessive for the fifth consecutive month in some portions of the State. However, the only flooding reported was on the Assunpink River, which went slightly over flood stage at Trenton as a result of rainfall amounts of more than 2 inches on the 12th-13th.	0	N.A.
Southeast Atlantic Coast Streams	There were two periods of relatively heavy rainfall during November. Amounts of 1.5 to 3 inches occurred on the 7th-8th and 1.5 to 6 inches on the 10th-13th with the heavier amounts in the mountainous headwaters. The Neuse River went slightly over flood stage at Smithfield, NC, on the 14th. Lowland flooding was reported below Columbia, SC, on the Congaree River the 14th-17th. Lowland flooding continued on the lower Savannah River from late October ending on the 13th and occurred again from the 18th into December.	0	N.A.
	EAST GULF OF MEXICO DRAINAGE		
Tombigbee River Basin	There was no river flooding during November, however, three instances of urban flooding occurred in the basin. On the 6th, Mobile, AL, received 7 inches of rain, of which 6.68 inches fell during an 8.5-hour period and over 3 inches in a one-hour period. Low areas were inundated by 2.5 to 3 feet of water. Some evacuations were necessary, and 20 people were stranded along Three Mile Creek. On the 9th rainfall of 5.5 inches caused road and highway flooding in Baldwin County. Locally heavy rainfall in the Birmingham, AL, area on the evening of the 11th caused urban flooding in the Huffman and Roebuck areas with water up to a foot in depth. More than 2 inches of rain was recorded at the Birmingham office.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

NOVEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	EAST GULF OF MEXICO DRAINAGE-Cont'd		
Pearl River	Flooding continued from October on the lower Pearl River in Louisiana, ending by the 5th. Rains of 2.5 inches on the 5th-7th above Bogalusa, LA, caused flooding there on the 8th-13th, with a crest 1.7 feet over flood stage on the 11th.	0	N.A.
	UPPER MISSISSIPPI DRAINAGE		
Des Moines River Basin	From 3 to 7 inches of snow fell over the area on the 26th. This was followed by rains of 1 to 3 inches on the 29th, which caused complete removal of the snow cover. Rises occurred on all streams in the area with Cedar Creek exceeding flood stage by about 1.5 feet on the 30th. There was little damage at this season of the year.	0	N.A.
	MISSOURI BASIN		
Kansas River Basin	Rains of about 2 to 4 inches occurred on the 1st-2d without significant runoff. From 5 to 10 inches of snow fell over the area on the 19th and 6 to 12 inches on the 25th, followed by several days of low temperatures. On the 29th extremely warm air with temperatures in the upper 60's was advected over the area resulting in rapid snowmelt and saturated soil conditions. That evening thunderstorms produced 1 to over 2 inches of rain over the area. Some small stream flooding occurred and Stranger Creek crested 1.6 feet over flood stage on December 1. No significant damage occurred at this season of the year.	0	N.A.
Missouri River	The record high releases from upstream reservoirs continued throughout November with lowland flooding along the Ponca to Rulo, NE, reach. No reporting stations were over flood stage.	0	N.A.
	LOWER MISSISSIPPI BASIN		
Big Black River	Lowland flooding occurred along the Big Black River in Mississippi on the 7th-14th with a crest 3.3 feet over flood stage on the 8th. Timber and agricultural land was affected. Rains of up to 2 inches over the headwaters on the 5th-6th caused the flooding with the stream already at high levels from the previous month.	0	N.A.
Lower Mississippi	Serious urban flooding occurred at and in the vicinity of Moissant International Airport on the afternoon of the 5th. The airport station, just outside New Orleans, reported 8.54 inches of rain that afternoon.		
Southeast Texas Streams	From 2 to 3 inches of rain fell over the headwaters of Pine Island Bayou on the 1st-3d with the stream exceeding bankfull stage but cresting short of flood stage. Up to 3.6 inches of rain was reported over the lower Trinity River with the stream slightly exceeding flood stage at Moss Bluff.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

NOVEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE		
Coastal and Willamette Basin Streams in Oregon	Precipitation of 2 to 5 inches over the north Coastal Range the last of November caused up to one foot of flooding on the South Yamhill River in the Willamette Basin and the Siletz River. The Wilson River crested nearly 2 feet over flood stage at Tillamook and minor flooding occurred on the Nehalem River.	0	32
North Coastal Streams in Washington	Rains ranging up to more than 3 inches on the 23d-24th caused strong rises on several coastal streams. The Nooksack River crested 0.5 foot over flood stage at Deming. The Skagit, Stillaguamish, Snoqualmie, and Snohomish Rivers crested near flood stage with possible minor flooding on the latter two streams.	0	N.A.
	ALASKA		
	Ice formation on the bottoms of streams in the Anchorage and Valdez areas and in the Mantanuska and Susitna Basins occurred during November resulting from high radiation losses on clear, cold nights. This caused ice jam flooding on Willow Creek in the Susitna Valley affecting a reach 10 miles long, threatening 15 homes, and causing the evacuation of 5 families. No stage or damage reports are available.	0	N.A.
	PUERTO RICO		
	Severe urban flooding and some small stream flooding (Margarita Creek) occurred on the 19th in the western portion of the San Juan metropolitan area. Rainfall amounts of 5 to 7 inches during a 3-hour period were responsible for this flooding. No river flooding was reported, although heavy showers continued over the western portion of the island for several days following this event with some additional drainage flooding and rivers reaching bankfull stages.	0	N.A.

NO DATA RECEIVED

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O3

REFERENCE NOTES

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES   Dates in the table apply to the period 24 hours prior to time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. (See individual Climatological Data for times of observations).

+	And also on an earlier date or dates.
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

B	Number of days maximum 21.1°C. or above for Alaskan Stations.
Y	Peak Gust.
+	And also on an earlier date or dates.
U	Indicates Urban site.
R	Indicates Rural site.
Ø	Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
$°F. = \frac{9}{5} \times °C + 32$
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

STORM SUMMARY:

°	Includes crop damage.
C	Crop damage.
*	No occurrence of storms or unusual weather phenomena reported.
@	Includes heavy sleet storm.
#	Freezing drizzle and freezing rain, commonly known as glaze.
Ø	For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
‡	No Storm Data Report received for this State.
<>	Report Incomplete.
†	Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5 Million
7	$5 Million to $50 Million
8	$50 Million to $500 Million
9	$500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

1/	Flooding continued at the end of the month.
NA	Not available.

FLOOD STAGE DATA:

#	Highest Stage Observed
1/	Continued at end of month
___	Highest Stage of Record
E	Estimated
P	Provisional (Flood Stage)
U	Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

*	Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
+	Observations for these stations are scheduled at 0000 G.C.T.
†	Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

REFERENCE NOTES

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

()	Clouds Present	DM	Moderate Dust	HM	Moderate Haze	KS	Slight Smoke
*	Values corresponding to true solar noon	DS	Slight Dust	HS	Slight Haze	M	Moderate Haze-indeterminable
BD	Blowing Dust	F	Fog	I	Intense Haze-indeterminable		
BN	Blowing Sand	GF	Ground Fog	K	Smoke	N	Sand
D	Dust	H	Haze	KI	Intense Smoke	S	Slight Haze-indeterminable
DI	Intense Dust	HI	Intense Haze	KM	Moderate Smoke		

SOLAR RADIATION TOTALS: Langley is the unit used to denote one gram calorie per square centimeter.

* Values with an asterisk are interpolated.
Data are only for those stations equipped with Eppley Model II sensors.

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega\ \Omega\ \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

NATIONAL SUMMARY

DECEMBER 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

ve normal temperatures early in December helped
snow cover in parts of the central and northern
at Plains and thus added much needed moisture to
seeded crops. Growth response was minimal, how-
, because even these above normal readings were
er cool. Average temperatures for the month were
al or above normal in most of the Nation, except
central Rockies, western and central California,
Southeast, and northern New England.

ipitation was below normal from western Texas to
ern Kansas and southeastern Colorado and north-
ward through northern Minnesota. Most of penin-
Florida also complained of dry weather.

mber weather began on a warm note with above nor-
temperatures across most of the Nation during the
t two weeks. The north central Great Plains in
first week and the northwestern Plains and Far
in the second week were the exceptions with
age temperatures 3 to 8° below normal. The gen-
ly warm weather reduced fuel requirements of up
0%.

in the Pacific Northwest persisted through the
and caused extensive flooding--the worst in re-
years--in the lowlands of western Washington.
where heavy snow fell in the upper Great Lakes
on with lighter amounts in the lower Lakes area.
nter storm in the Northeast added an extra foot
now in the Vermont mountains, where Stowe
ured nearly 2 feet.

the 8th to the 14th a series of disturbances
ng across the Nation triggered a variety of pre-
tation. A winter storm that developed in the
spread snow from the Pacific Northwest into the
hern Plains and the Great Lakes area. Heaviest precipitation occurred from northeast Oklahoma and eastern Kansas northeastward through southern Michigan where 1 to 2 inches fell during the week. On the 9th showers and thunderstorms developed from Florida into the Carolinas. On the 13th cold air pushing southward triggered thunderstorms in Illinois, Indiana, and Michigan. A drop of 30° was common in Kansas and Iowa on the 14th while unseasonably warm weather caused record temperatures throughout the middle Mississippi and Ohio Valleys.

In the third week of the month the temperatures averaged below normal throughout most of the Nation. The arctic air that had moved into the Plains earlier gradually encompassed most of the country. Precipitation focused mainly on the eastern third of the Nation as the arctic air pushed the warmer air out. Along a line from eastern Texas to New England precipitation fell along the eastward moving front. Blowing snow and frigid temperatures dominated weather patterns in the northern and central portions of the country.

The arctic air continued to affect the eastern portion of the country during the last week of December, but above normal temperatures prevailed throughout most of the West and from the Great Lakes region to western Texas and beyond. Storms moving into the Pacific Northwest brought Pacific maritime air that gradually ameliorated the frigid arctic air in the West. Western Washington collected 2 to 5 inches of rain and areas southward into central California received lesser amounts. Towards the end of the month, a low pressure system in southeast Texas spread much needed precipitation into Texas, New Mexico, Oklahoma, and Arkansas.

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

DECEMBER 1975

Herbert J. Thompson - Office of Hydrology

Major flooding occurred in the Pacific Northwest early in December with record or near record crest stages on several streams. Preliminary damage estimates indicate losses of $21 million in the western Washington coastal drainage and more than $6 million in the Columbia and Willamette Basins and the North Coastal drainage of Oregon.

Otherwise, flood losses were generally light, partly due to the season of the year. Minor to moderate flooding was reported on Great Lakes tributaries in Michigan and Indiana; several streams along the Atlantic coast; the Pearl and upper Tombigbee Rivers in Mississippi; the lower Grand River in Missouri; the middle Wabash River in Indiana; South Chickamauga Creek in Tennessee; the Cache, Black, and St. Francis Rivers in Arkansas; the Illinois River in Oklahoma; the Calcasieu River in Louisiana; the Navidad and lower Guadalupe Rivers in Texas; and the southern Oregon coastal drainage.

Small stream flooding was reported in southern Alabama and the Florida panhandle and minor ice jam flooding on the Plate River in Nebraska.

These and other hydrologic events of unusual significance or involving loss of life or property damage are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ST. LAWRENCE DRAINAGE		
Great Lakes Tributaries in Michigan, Indiana, and Ohio	Minor flooding occurred on several streams in this area. This was caused by melting of a 4 to 6-inch snowcover within 18 hours on the 14th followed by rains of 1 to 2 inches on the 15th-16th. The lower Grand, Shiawassee, Flint, Clinton, and Manistee Rivers in lower Michigan and the St. Mary's River in northeastern Indiana exceeded flood stage slightly at some points. Bankfull stages were reported at other points on some of these rivers and on the Kalamazoo, Maple, and Red Cedar Rivers in lower Michigan. Lowland flooding was reported along the Tiffin River in northwest Ohio on the 16th-17th. No stages were available.	0	N.A.
	ATLANTIC SLOPE DRAINAGE		
New Jersey Coastal Streams	Snow on the 25th changing to rain later in the day amounted to about 1.5 inches of precipitation and caused some runoff with the Millstone River, slightly exceeding flood stage at Blackwells Mills.	0	N.A.
South Atlantic Coastal Streams	During the first half of December a series of cold fronts moved across the area with rainfall amounts generally less than an inch resulting from each storm. Minor flooding occurred on the Lumber River on the 18th to the 21st. Later in the month heavier amounts of 1 to 2 inches fell on the 25th-26th and again on the 30th-31st. Flooding recurred on the Lumber River and continued into January with a crest 1.8 feet over flood stage on January 3. The Saluda River went over flood stage briefly at Chappells, SC, on the 31st. Lowland flooding on the lower Savannah River which began in November continued until the 29th with a second crest 1.2 feet over flood stage at Clyo, GA, on the 9th-10th. Monthly	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

DECEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE_Cont'd		
	rainfall totals of up to 8 inches in the mountainous headwaters and 3 to 4 inches in the lower reaches were reported over the area.		
	EAST GULF OF MEXICO DRAINAGE		
Florida Panhandle & Southern Alabama Streams	Rainfall was generally below normal during December. However, locally heavy rainfall the 29th to 31st caused some urban and small stream flooding. Evergreen, AL, received 5.80 inches during the night of the 30th, which resulted in the flooding of low lying areas of Brewton, Al, by Murder Creek. There is no gage at Brewton at present. The Conecuh and Escambia Rivers approached flood stage during this period.	0	N.A.
Pearl and Upper Tombigbee Rivers	Monthly rainfall over Mississippi was a little above normal except in the northeast with totals generally in the range of 3 to 5 inches. Amounts of 1.5 to 2 inches occurred the 25th-26th with minor flooding on the East Fork of the Tombigbee. Increased releases from Barnett Reservoir caused lowland flooding around Jackson, MS, on the Pearl River which extended into January. Minor flooding also occurred around Bogalusa, LA, which continued into January.	0	N.A.
	UPPER MISSISSIPPI BASIN		
	There was no excessive precipitation during December and only minor rises occurred on streams in the basin, except at Durand, WI, where an ice jam on the Chippewa River caused a 4.5 feet rise on the 19th. Ice jams caused 2 feet fluctuations on the Mississippi River between Wabash and Winona, MN. Navigation on the Mississippi ended on the 12th at St. Paul, MN, on the 13th at Winona, and on the 14th at Guttenberg, IA. This was the latest date on record at St. Paul.		
	MISSOURI BASIN		
Platte River	An ice jam in the vicinity of Schuyler, NE, caused minor flooding of low lying areas from the 16th to the 22d. No losses have been reported.	0	N.A.
Grand River	Several days of moderate precipitation late in November, mostly as snow followed by 1 to 2 inches of rain on November 30 resulted in the lower Grand River exceeding flood stage slightly at Sumner, MO, on the 1st.	0	N.A.
Kansas River Basin	A crest 1.6 feet over flood stage occurred on Stranger Creek at Easton, KS, on the 1st. This resulted from snowmelt and rainfall late in	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

DECEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
	November and is discussed in the November Report.		
Missouri River	On the 1st, Gavins Point Dam began decreasing its record releases which had been maintained at about 61,000 c.f.s. since July. The flows were decreased slowly to reduce bank cave-in until a minimum of 20,000 c.f.s. was reached. Lowland flooding above Rulo, NE, ended a few days after the 1st. No reporting stations were over flood stage during this period.		
	OHIO BASIN		
Wabash River	Precipitation over the Basin during December averaged about one inch above normal. The heavier amounts of 1 to 1.5 inches occurred November 30-December 1, about 0.5 inches on the 6th-7th, and from 1 to 1.5 inches on the 14th-15th. Lowland flooding occurred during the period of the 15th-20th on the main stem of the Wabash from above Lafayette, IN, to below Terre Haute, IN. A crest 6.2 feet over flood stage was reported at Lafayette with lesser flooding downstream. Damage is generally light at this season of the year.	0	N.A.
Tennessee River Basin	Two brief periods of minor flooding occurred on South Chickmauga Creek late in December. Rains of about 2 inches on the 26th and 1.5 inches on the 31st were reported at Chattanooga. Crests were less than a foot over flood stage.	0	N.A.
	WHITE BASIN		
Cache and Black Rivers	Lowland flooding occurred along the Cache and lower Black Rivers in Arkansas. Rains of up to more than 2 inches late in November were followed by amounts of 2 to 4 inches over these basins on the 5th-6th. The Cache River crested 1.6 foot over flood stage on the 16th with flooding continuing into January. The Black River crested 5.4 feet over flood stage at Black Rock on the 7th. Damage from this type of flooding is light at this season of the year.	0	N.A.
	ARKANSAS RIVER BASIN		
Illinois River	Precipitation over the Arkansas River Basin during December ranged from well below normal over the Colorado and Kansas portions to near or slightly above normal in Oklahoma. The only flooding reported was on the Illinois River which exceeded flood stage slightly at Tallequah, OK, on the 7th in response to rains averaging about 2 inches on the 5th-6th.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

DECEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	LOWER MISSISSIPPI BASIN		
St. Francis River	Two periods of flooding occurred on the St. Francis River with crests about 2 feet over flood stage at St. Francis, AR. The first period of flooding, the 6th-9th, was in response to rains of 2 to 4 inches on the 5th-6th following amounts of up to more than 2 inches in late November. The second period of flooding began the 27th after rainfall of more than 1.5 inches and extended into January.	0	N.A.
	WEST GULF OF MEXICO DRAINAGE		
Calcasieu River	Minor flooding occurred on the upper Calcasieu River at Hineston, LA, on the 27th-29th. This resulted from rains of 1.5 to 2 inches on the 25th. Heavy rains late in November with light amounts during December had kept soil moisture fairly high.	0	N.A.
Coastal Drainage in Texas	Although soil moisture conditions continued very dry over the western portion of this area significant flooding occurred on the lower Navidad and Guadalupe Rivers. This was in response to heavy rain on the 24th along a line from Goliad to Ganado. These communities reported 7.00 and 7.58 inches respectively for the storm. The Navidad crested 6.74 feet above flood stage near Ganado and the Guadalupe crested 6.3 feet over flood stage at Dupont. Over the eastern portion of the area soil moisture conditions were moist during December. In the lower Neches Basin 2 to 3 inches of rain on the 25th caused rises on streams with Village Creek cresting near flood stage at Kountze and Pine Island Bayou exceeding bankfull stage but cresting short of flood stage on the 29th.		
	PACIFIC SLOPE DRAINAGE		
South Coastal Streams in Oregon	Heavy rainfall of up to 7 inches over a low level snowpack late in November and the first few days of December caused strong rises on the Rogue, Coquille and Umpqua Rivers with some local flooding on smaller tributary streams of these rivers. The only river flooding was on the South Fork of the Coquille which crested twice during the period each time about 2 feet over flood stage. Some secondary roads and pastures were inundated.	0	N.A.
North Coastal Streams in Oregon	Serious flooding resulted from a series of storms during the period November 30 to December 4 which deposited rainfall amounts totaling from 17 to 23 inches over much of this area. Initial flooding began in the Wilson and Nehalem River basins along the northwest Oregon coast on the 30th and lasted 5 days on the Wilson River and about 3 days on the Nehalem River. Crests 6.2 and 5.4 feet over flood stage occurred on the	0	850

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE-Cont'd		
	Nehalem River at Foss and the Wilson River at Tillamook respectively. Greatest damage occurred at Tillamook where a 150-foot break in the Trask Dike and a 50-foot break in the Wilson River's south bank just north of town forced 10 families to vacate their homes, flooded more than a dozen businesses along Highway 101 north of town, blocked traffic, and uprooted a 1,000 gallon gasoline tank which spewed gasoline into the swirling water. About $500,000 damage was done to timber and dairy lands, and another $200,000 on slides and flood cleanup. Two trailer parks on the Necanicum River near Seaside were inundated but no trailers floated. Additional streams down the coast topped their flood stages by 1-3 feet with greatest on the Siuslaw River at Mapleton (flood stage 18 feet), which crested at 21.2 feet by noon on the 4th. Rainfall totaling 11.39 inches fell at Alsea Salmon Hatchery during the first four days of December, with greatest 24-hour total of 5.19 inches occurring the morning of the 1st. A mud and log slide at Mapleton blocked Oregon Highway 126, railroad tracks, and also damaged the water supply reservoir of Mapleton's 500 residents. Some 6 to 10 families left their homes near the Siuslaw River because of flooding.		
Upper Columbia River Basin in Idaho	Heavy rains of 1 to 3.5 inches combined with snowmelt to cause flooding along the Coeur D'Alene River early in December. Crests were about 2.5 feet over flood stage at Enaville and Cataldo. The warming trend caused an ice jam on the St. Joe River just below Calder cutting off access to the town and flooding some basements. The river crested 3 feet above flood stage at Calder with flooding for about 12 hours before the jam broke. No damage occurred downstream. Rains of up to more than an inch combined with melting snow and impervious frozen ground to cause local drainage flooding of fields and roads in many areas of eastern Washington and northern Idaho on the 26th. Losses of $5,000 occurred to roads in the Yaak River Basin on the 4th. The Yaak is a tributary of the Kootenai River in northwestern Montana.	0	N.A.
Middle Columbia River Basin	Serious flooding occurred in the Yakima River Basin early in December. According to the U. S. Geological Survey the highest stages and flows in 8 years of record were reported on the Teenaway River near Cle Elum and the Yakima River at Union Gap, WA. Crests at Weather Service reporting stations on the lower Yakima were more than 3 feet over flood stage. This flooding resulted from the heavy rains in western Washington, which extended over the Divide, and from excessive snowmelt caused by the warm temperatures. During the period November 30-December 4, Stampede Pass, WA, reported nearly	0	4,135

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

DECEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE-Cont'd		
	19 inches of precipitation, mostly rain, and the water-equivalent of the snowpack dropped by 5 inches. About 25 people were evacuated in the Pine Glen and Elk Meadows areas and a Milwaukee Road freight train lost 2 engines and 11 cars in Big Creek 4 miles east of Easton when the bridge washed out. Losses were estimated at $4,120,000 in the Yakima Basin. No flood related deaths were reported. The Wenatchee River crested 0.8 foot over flood stage at Peshastin, WA, with losses of $10,000. Heavy rains over the Walla Walla and Umatilla Basins caused light flooding along these streams with losses of $5,500 in the Walla Walla Basin.		
Willamette River Basin	Serious flooding also occurred on several tributaries of the Willamette River early in December. Rainfall during the period November 30-December 4 ranged up to 7 inches in the valley with greater amounts over the higher elevations of the Coastal and Cascade Ranges, with snowmelt also a factor. The most seriously affected streams were: the South Yamhill River with crests from 4 to 4.5 feet over flood stage; the Luckiamute and Pudding Rivers with more than 3.5 feet of flooding; and the Clackamas River and Johnson Creek with crests 1.7 and 1.5 feet over flood stage respectively. Minor flooding was reported on the Santiam, Mary's and Tualatin Rivers.	0	1,152
Lower Columbia River	Flooding occurred on the main stem of the Columbia River around Longview, WA, with a crest 1.4 feet over flood stage there on the 5th. Although neither the Willamette nor the Cowlitz Rivers were reported over flood stage, heavy inflow from these streams plus heavy local inflow from the rains discussed above apparently caused this one point on the Columbia to exceed flood stage.	0	N.A.
Coastal Streams in Washington	Major flooding occurred in this area of western Washington early in December. A record crest stage was reported on the Snohomish River at Snohomish and the Cedar River at Renton and near record stages were observed on the Chehalis and Snoqualmie Rivers. The following discussion was exerpted from a report on the flooding by C. T. Beach of the Seattle Weather Service Forecast Office: Pre-Flood Weather Patterns - Weather Discussion Pacific weather patterns prior to the period of the floods prescribed the route of very warm and moist air which was the source of prolonged heavy rain over western Washington and the Cascade Mountains. A strong high pressure pattern persisted over the	0	21,000

Basins and Streams | FLOOD EVENT | Lives Lost | Preliminary Estimate of Property Damage (thousands of dollars)

PACIFIC SLOPE DRAINAGE-Cont'd

eastern Pacific from November 26th until early on November 29th. This pattern stretched from 20°N latitude northward to 55°N with a central axis about 750 miles west of the Washington Coast. West of this high was a vigorous elongated low pressure pattern. In the boundary between these two systems there developed a strong northward flow of almost tropical air. This fast moving air mass was deep. Changes in the upper air patterns associated with the surface weather systems indicate very well the arrival of the warm air in the extreme north part of the Gulf of Alaska on November 28th.

Shortly after this the north part of the eastern Pacific high weakened to permit the development of a low pressure center with an associated frontal system in the extreme north part of the Gulf of Alaska just west of Sitka, AK. The continued development of this surface low hastened further deterioration of the protective high pressure west of the Washington Coast.

Early on the 30th warm moist Pacific air originating 1500 miles westward in the Pacific crossed the Washington and Oregon coastline. Snow began falling over the Cascades late on the 29th and the rate of fall became increasingly heavy as the warmer air arrived. Snow in the mountains changed to heavy rain by the afternoon of the 30th.

Indexing the events taking place at the headwaters of many rivers was the weather at the Stampede Pass weather station at 4000 feet in the Cascades. Snow and then rain fell continually at Stampede Pass for 70 hours. The rain then diminished to less than measureable amounts for two hours between 6 P. M. and 8 P. M. on December 2d. Rain resumed after that time and continued for 35 hours more. The rate of rainfall was continually moderate to heavy, beginning as a heavy rate of fall after 3 P. M. on November 30th which continued through 11 P. M. December 1st. 6.84 inches of rain fell in the 24 hours ending at 11 P. M. on the 1st.

A total of 18.81 inches of rain fell at Stampede Pass in five days and five hours from 8 P. M. on November 29th to midnight between December 4th and 5th. There were 44 inches of snow on the ground at the station at 4 A. M. December 1st. The water equivalent of the snow pack was then 11.9 inches or 27% water. On the 4th there were 16 inches of snow on the ground with a water content of 6.6 inches or 41%.

The total of 6.75 inches in 24 hours on the 1st is estimated to have a return period greater than 50 years.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)

PACIFIC SLOPE DRAINAGE-Cont'd

Snoqualmie River

The first of the lower river basins to show significant rises after the deluge of rain began were those of the Snoqualmie and Skykomish Rivers (which join to form the Snohomish River) and the Cedar River.

The Snoqualmie Falls of the Snoqualmie River rose from a flow of 4510 cubic feet per second (c.f.s.) to 10 P. M. on November 30th to 10,350 c.f.s. at 6 A. M. December 1st and continued to rise rapidly. In seven more hours that flow had more than doubled and downstream at Carnation the warning stage of 51 feet had been reached. Flood stage (54 feet) at Carnation was reached by midnight on the 2d and the river was rising at a rate of one half foot per hour.

Upstream at Snoqualmie Falls the flow reached a preliminary crest at a flow rate of 47,380 c.f.s. at 10 A. M. on the 2d. After that time the flow diminished gradually in response to a short lull in the heavy rain at upstream points. But after 9 P. M. that same day the river began to rise again. The flow crest at the Falls was reached at 6 A. M. on the 3d at a flow rate of 52,210 c.f.s.

In the lower valley below the Falls at Carnation the reflection of diminishing flow at the Falls produced a flat preliminary crest of 59.2 feet - more than five feet above flood stage - at 7 P. M. on the 2d. This flattening continued with only a slight fall to 59.0 feet by 6 A. M. on the 3d. The river then rose to the final crest stage at Carnation at 59.3 feet at noon the same day. The river receded slowly from the final crest stage remaining above flood stage of 54 feet until nearly 3 P. M. on the 5th. The river returned to below bankfull stage by 8 A. M. the 6th.

The Skykomish River

The other branch of the Snohomish River - the Skykomish - began to rise rapidly near Gold Bar during the evening of November 30th and continued to rise through December 1st reaching the flood stage of 15 feet at Gold Bar shortly before 1 A. M. on the 2d. The river continued to rise reaching the first of three crests - 19.28 feet, more than four feet above flood stage - at 8:30 A. M. December 2d. After low level snow had contributed to the runoff to the river and heavy rainfall had diminished for a short time the river receded and then rose in response to heavier rainfall. The major crest stage of 19.7 feet - 4.7 feet above flood stage - was reached at Gold Bar gage at 3 A. M. on the 3d.

The river again receded and then crested once

PACIFIC SLOPE DRAINAGE-Cont'd

more at 19.17 feet at 6 A. M. on the 4th. Colder and drier air then moved over the Skykomish basin cutting off the rain and the river began to fall rapidly. The river level dropped to 16.1 feet by noon on the 4th and the river returned to below flood stage (15 feet) at 4:30 P. M. that same day. The river continued to recede.

Snohomish River

The water from the rapidly rising Skykomish River reached the main stem of the Snohomish River first. The Snohomish River at Snohomish began to rise significantly after 3 A. M. on the 1st. At 11 P. M. on the 1st the flood stage of 25 feet was reached and passed and the river continued to rise rapidly. Two high tides in Puget Sound at the river mouth between 4:30 A. M. and 3 P. M. on the 2d aided the rise in the river at Snohomish 10 miles upstream. By 9 P. M. on the 2d a river stage of 32.38 feet was recorded at Snohomish. This was 7 feet above flood stage and indicated that over flow was occurring over many dikes in the lower Snohomish valley. Shortly after this river stage was recorded, a sharp drop in the river level indicated that dikes had broken upstream. A flood control pumping station was destroyed, and the dike in which it was built was breached. The pumping station was in the French Creek Flood Control District upstream from the City of Snohomish and between Snohomish and Monroe. The river rushed through the break and covered several thousands of acres of farmland previously protected by the dike.

The river gage at Snohomish indicated a drop in river level to 30.93 feet at 3 A. M. on the 3d. At about this time the flood from the Snoqualmie Basin combined with the Skykomish Flood in lower Snohomish valley, and the Snohomish flood level began to rise again. At this time almost no stream flow relationships existed in the lower Snohomish River Basin since dikes were breached and water had spread across the valley. The flood crested at 33.16 feet at the Snohomish gage between midnight and noon on the 4th. (The telephone telemetry at the Snohomish gage was inoperative between those hours. The crest was taken by U. S. Geological Survey from a high water mark outside the well.) This crest exceeded the old record crest of 30.89 feet in 1959 by more than 2 feet. A stage of 35.0 feet occurred in 1906 before records began. After noon on the 4th (the gage height was 33.0, 8 feet above flood stage) the flood began to recede slowly. At 3 A. M. on the 5th, the Snohomish River gage still indicated 32.4 feet and the level of the flood only dropped to 30.7 feet by 4:30 P. M. that same day. Thirty hours later the water level had dropped to flood stage (25 feet). At 8:30 A. M. on the 7th the gage reading at Snohomish was 22.92 feet and the river

PACIFIC SLOPE DRAINAGE-Cont'd

continued to fall slowly.

Major damage occurred in the Snohomish Basin from this record flooding. About 1,300 beef and dairy cattle were drowned, 130 homes were flooded and 35,000 acres in Snohomish County and several thousand more in King County were inundated.

Cedar River

The Cedar River Basin was another area in which flood damage was severe. This was due in part to the fact that no major flooding had occurred in the basin for the past 25 years although the river is relatively uncontrolled below the dam at Chester Morse Lake. Residential and a little commercial development had expanded within the flood plain during that time.

Significant rises in the river below Chester Morse Lake began early on the 1st. At 7 A. M. the Landsburg river gage read 3.8 feet and the gage downstream at Renton read 8.9 feet. Flood stage at Landsburg is considered to be 5.5 feet and 10 feet at Renton. At Landsburg flood stage was reached at 10 P. M. the 1st.

After that time the river rose steadily to a crest stage of 8.4 feet recorded first at 3 A. M. on the 3d. The river remained at that level or only slightly below for the next 29 hours, reaching a final crest stage of 8.49 feet sometime between the hours of 4 A. M. and 8 A. M. on the 4th. A slow falling trend began after 8 A. M. but the river level remained above 8 feet at Landsburg until after 5 P. M. on the 4th.

At the time of the final crest stage colder and drier air spread over western Washington to the Cascades cutting off heavy rain. But the river receded slowly. The river level did not return to flood stage (5.5 feet) until after 3 P. M. on the 6th.

The Cedar River had been above flood stage for four days and eighteen hours and for several more hours downstream to the mouth at Renton. This undoubtedly increased the property damage. Fragmentary data reported from the Renton gage was not considered reliable. However, the crest of 14.2 feet reported by the U. S. Geological Survey is a new record at that point.

Stillaguamish River

In the Stillaguamish River Basin rain fell at the average rate of more than two inches per 24 hours at both Darrington and Verlot ranger stations during the four days November 30th through December 3d. The river responded quickly. A river level of a little more than 4 feet measured

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)

PACIFIC SLOPE DRAINAGE-Cont'd

at 4 P. M. November 30th at the North Fork river gage rose to ten feet by 11 P. M. December 1st. On the south fork of the Stillaguamish near Granite Falls the rise was even more dramatic. A 4.9 foot level at 3 A. M. November 30th changed to 11.7 feet by 1 P. M. December 1st. Both branches of the river continued to rise rapidly.

At Arlington on the main stem of the river the warning stage of 13 feet was reached at 7:45 P. M. on the 1st. Flood stage at Arlington - 16 feet - was reached at about 6 A. M. on the 2d. The rapidly rising river crested the first of three times between 1:30 P. M. and 3:30 P. M. at 18.75 feet that same day.

After receding to near 17 feet the river rose to a second crest of 18.50 feet at 7 A. M. on the 3d at Arlington.

The river level dropped again - this time to 14.50 feet, 1.5 feet below flood stage - at 8:45 P. M. on the 3d but rose to a crest a third time at 17.90 feet at 7 A. M. on the 4th.

The heavy rain stopped over the upper Stillaguamish Basin after 2 A. M. on the 4th. By 8 A. M. that day the river began to recede at Arlington. The river returned to flood stage at 11:30 A. M. and was back within its banks at 3 P. M.

Damage in the Stillaguamish basin is believed to have been relatively light.

Skagit River

The largest river system in the coastal drainage - the Skagit - responded to the heavy rain a little more slowly. Tributaries such as the Sauk River rose significantly on the 1st but it was only after 9 P. M. on that day that the main stem of the Skagit at Concrete began to rise steadily. Flood stage - 29 feet at Concrete - was reached at 10 A. M. on the 2d and then the river continued to rise rapidly. Shortly after midnight on the 3d the river level had risen to more than 34 feet - 5 feet above flood stage. The first crest at 35.75 feet was reached at Concrete at 8 A. M. on the 3d, after which the river receded slowly to a stage of 33.59 feet at 6 P. M. the same day.

The river rose again to reach a second crest stage of 36.80 feet at about 6 A. M. on the 4th. With the ending of the rain a slow falling trend began at Concrete after that time and by 4:30 P. M. that day the stage at Concrete was 34.20 feet -- still 5 feet above flood stage but falling. By 8 A. M. on the 5th the river level had dropped back to just below flood stage of 29 feet and

PACIFIC SLOPE DRAINAGE-Cont'd

the river continued to fall.

Downstream at Mount Vernon significant rises in the river level began during the evening of the 1st and continued during the early morning of the 2d. The river stage at 3 A. M. on the 2d at Mount Vernon was 21.4 feet but was 2 feet higher 5.5 hours later. Flood stage - 28 feet at Mount Vernon - was reached at 7 P. M. on the 2d and at that time the river was rising at a rate of almost one foot every three hours.

From 3 A. M. on the 3d until 9 A. M. the rate of rise at Mount Vernon slowed. A more rapid rise began after 9 A. M., beginning at a stage of 30.9 feet until a flattening of this rise began at 9 P. M. at a stage of 34.4 feet - more than 6 feet above flood stage. This flattening continued until 6 A. M. on the 4th when a stage of 34.7 feet was recorded. From that point a river level rise began and continued to a crest stage at Mount Vernon of 35.5 feet at 6 P. M. The crest was flat remaining at that level until a slow falling trend began after midnight on the 5th.

At 3 A. M. on the 5th the recorded height of the river was 35.2 feet and the rate of fall of the river level then increased. At 4:30 P. M. the stage was 31.5 feet and by 10:30 P. M. the stage was down to 29.4 feet, less than 2 feet above flood stage. The river stage at 3 A. M. on the 6th was 28.5 feet, just .5 foot above flood stage, and the river continued to fall.

The December 1975 flood in the Skagit Valley ranks fifth in magnitude to floods of record since 1909. The next greater flood was that of 1951.

Nooksack River

In the Nooksack River Basin flooding began below Deming early on the 2d and continued in the lower valley until the morning of the 5th.

Steady rises in the river level at Deming began early on the 1st. The recorded river stage at 3 A. M. that day was 7.15 feet. Twenty-four hours later flood stage - 12 feet - had been surpassed and the river continued to rise.

On the 3d at 3 A. M. the crest stage of 15.67 feet at the Deming gage occurred. After that time the river level fell slowly to 13.3 feet at 9 P. M. on the 3d. A rising trend then resumed and a second minor crest stage of 14.39 feet was reached at 5 A. M. on the 4th.

When the colder and drier air arrived early in the morning of the 4th ending rain in the basin, the river receded rapidly at Deming, returning

PACIFIC SLOPE DRAINAGE-Cont'd

to below flood stage by 4:30 P. M. that same day.

The Nooksack Valley probably suffered the least damage of all of the river basins in northwest Washington during this flooding episode.

Chehalis River

Headwaters of the Chehalis River originate at relatively low elevations except for one tributary which rises at an elevation near 5000 feet in the Cascade Mountains.

Heavy rain in the upper basin began early on the 30th and spread to lower headwaters points during the day. At Centralia the river responded slowly to this rain until 4 P. M. that day. The river stage at Centralia at that time was 53.4 feet and a rapid rise began. By 8 A. M. on December 1st the river had risen to 59.1 feet - an increase of nearly 6 feet in 16 hours.

During the next 24 hours the rate of rise was slower but continued steadily. Flood stage - 63 feet at Centralia - was reached by 4 P. M. on the 2d, 48 hours after significant rises began. The river continued to rise steadily to a sharp crest at 71.17 feet - more than 8 feet above flood stage at Centralia - shortly after midnight on the 5th. The rain over the basin had almost completely stopped nearly 24 hours earlier than the time of the crest. Because of this the river level dropped more rapidly than it had risen at Centralia. By 4:30 P. M. on the 5th, 16 hours after cresting, the level had dropped nearly 4 feet to a stage of 67.5 feet. In 24 more hours - at 4:30 P. M. on the 6th - the river level had returned to below flood stage at Centralia and the river continued to fall.

This flood on the Chehalis ranked second in floods of record in terms of height of the crest. Only the great flood of January 1972 crested higher.

Skookumchuck River

The Skookumchuck River is a tributary of the Chehalis River entering the Chehalis at Centralia. Heavy rain over the headwaters on November 30th did not affect the lower valley between Bucoda and Centralia until after 4 P. M. that day. Significant rises in the river level began after that time at the Centralia river gage. The river rose steadily from a level of 75.9 feet at 4 P. M. on the 30th to 82.3 feet at 5:30 A. M. on December 2d. At that point the rate of rise slowed and then levelled off for a period of 4 hours ending at 8 P. M. on the 2d. The river rose again to reach flood stage at Centralia - 85 feet - at about 9 P. M. on the

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

DECEMBER 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE-Cont'd		
	3d. Twenty-five hours later at 10 P. M. on the 4th the river crested at 85.46 feet.		
	The rain had stopped falling in the Skookumchuck Basin early in the morning of the 4th and since runoff had ceased the river began to fall slowly. The river returned to flood stage shortly after 3 A. M. on the 5th. After that time the rate of fall increased. In the next 14 hours the river dropped 3 feet to 82.0 feet at the Centralia gage and the river continued to recede although at a slower rate. The Skookumchuck River was only a little above flood stage for approximately 29 hours. The latter part of this time frame included that time at which the crest stage was reached on the Chehalis River at Centralia. It would appear that some of the flooding from the Skookumchuck was back water from the Chehalis River. Damage is believed to have been light in this basin.		
	This flooding in western Washington was created by very heavy orographic rain over high headwaters such that the whole of each river basin was involved. All tributaries contributed to flooding. Some of these reached stages that caused major property damage within the individual tributary basins as well as adding to damage in the main stem basin. Such was the case with the Sultan River which is a tributary of the Skykomish River. Stage reports are not available on these tributary streams.		
	Preliminary estimates of damage by the Corps of Engineers indicate losses of $21 million. However, assessments of damage continue and final figures will not be available until after the spring planting season. Seven western Washington counties were declared disaster areas by the State and Federal Governments. About 4,800 people were displaced, 1,560 residences suffered flood damage, and 108,900 acres were inundated.		
	Record peak discharges were reported on several streams in the area by the U. S. Geological Survey with recurrence intervals of up to 70 years on the Cedar River and the Raging River in the Snohomish Basin.		
	ALASKA		
South Central Alaska Streams	The cold temperatures of November continued for the first half of December causing further icing of stream beds and flood plains in south central Alaska. Little Rabbit Creek near Anchorage went out of banks on the 19th due to icing of the stream bed and slush ice jamming. The flooding was minor and in part due to light rains and some snowmelt from warm temperatures in the third week. Several homes and roads were flooded.	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ALASKA-Cont'd		
	Almost the entire braided channel flood plain of the Matanuska River was covered by icings (aufeis) by the 28th.		
	PUERTO RICO		
	Most river basins in the northern sections of the island received nearly daily rains during December while the southern sections were limited to frequent heavy shower activity during the first two weeks of the month only. On the 9th there were very intense rains along the northeastern sections early in the morning with three-hour totals ranging between 3 and 5 inches centered in the Rio Piedras Basin. Flooding occurred in the lower basin from about the town of Rio Piedras into Puerto Nuevo and along the Margarita Creek where bank overflow occurred in the University Gardens Urbanization and the industrial park along Highway 2 to the west of San Juan City. This flooding is compounded by a drainage problem in that there is no outlet on the San Juan Bay end of Margarita Creek and the water backs up into these areas. A similar flood occurred in June 1970 in these areas with about 12 inches of rain in 6 hours over the same basin. Minor road damage and a few landslides were reported in the interior portions of the island but no other river flooding was reported although the showers were in the order of 3 to 5 inches in these areas over about a 6 hour period. A stagnant upper air trough remained over the Island until the 12th causing daily heavy shower activity in the interior and western portions.	0	N.A.

NO DATA RECEIVED

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code (s [illegible]) defined in the August 1962 WMO circular entitled 'PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA.

Units Milli-atmo-cms

Station	Day of month																															Mean O3
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

STORM SUMMARY CORRECTIONS

DATE	TABLE	STATE	CORRECTION
MARCH 1975	STORM SUMMARY	OKLAHOMA	TORNADOES: Injuries - 2
MARCH 1975	STORM SUMMARY	VIRGINIA	TORNADOES: Number - 1; ALL OTHERS: [illegible] - [illegible] Injuries - 3; Property - ?; Crops - 0
APRIL 1975	STORM SUMMARY	OKLAHOMA	TORNADOES: Number - 1; Days - 1; Injuries - 3
MAY 1975	STORM SUMMARY	MARYLAND & DC	TORNADOES: Number - 1; Days - 1; Damage - 4; WINDSTORMS: Crops - 3; ALL OTHERS: Property - 3; Crops - 3
MAY 1975	STORM SUMMARY	WISCONSIN	WINDSTORMS: Injuries- 12; Property - 6; Crops -

REFERENCE NOTES

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES: Dates in the table apply to the period 24 hours prior to time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. (See individual Climatological Data for times of observations).

+	And also on an earlier date or dates.
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

B	Number of days maximum 21.1°C. or above for Alaskan Stations.
Y	Peak Gust.
+	And also on an earlier date or dates.
U	Indicates Urban site.
R	Indicates Rural site.
Ø	Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
°F. = $\frac{9}{5}$ x °C + 32
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

STORM SUMMARY:

°	Includes crop damage.
C	Crop damage.
*	No occurrence of storms or unusual weather phenomena reported.
@	Includes heavy sleet storm.
#	Freezing drizzle and freezing rain, commonly known as glaze.
Ø	For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
‡	No Storm Data Report received for this State.
·	Report Incomplete.
†	Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5 Million
7	$5 Million to $50 Million
8	$50 Million to $500 Million
9	$500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

1/	Flooding continued at the end of the month.
NA	Not available.

FLOOD STAGE DATA:

#	Highest Stage Observed
1/	Continued at end of month
____	Highest Stage of Record
E	Estimated
P	Provisional (Flood Stage)
U	Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

*	Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
+	Observations for these stations are scheduled at 0000 G.C.T.
†	Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

REFERENCE NOTES

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

()	Clouds Present	DM	Moderate Dust	HM	Moderate Haze	KS	Slight Smoke
*	Values corresponding to true solar noon	DS	Slight Dust	HS	Slight Haze	M	Moderate Haze-indeterminable
BD	Blowing Dust	F	Fog	I	[illegible]		
BN	Blowing Sand	GF	Ground Fog	K	Smoke	N	Sand
D	Dust	H	Haze	KI	Intense Smoke	S	Slight Haze-indeterminable
DI	Intense Dust	HI	Intense Haze	KM	Moderate Smoke		

SOLAR RADIATION TOTALS: Langley is the unit used to denote one gram calorie per square centimeter.

* Values with an asterisk are interpolated.
Data are only for those stations equipped with Eppley Model II sensors.

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega\ \Omega\ \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ_S designates the type of measurement made.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

YEAR 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Lewis A. Blodgett, Meteorological Advisor, NCC

For the third successive year, a warm January prevailed in the eastern part of the Country. The only significant area of below normal temperatures occurred in the southwestern mountain States. Precipitation was above normal over most of the Nation, with dry areas in California, the Desert Southwest, northern Montana, parts of the Great Plains, and southern Florida.

February continued warmer than normal east of the Mississippi, but cold weather returned to the West. Parts of Montana and Wyoming averaged more than 10° below normal for the month, with the coldest weather early in the month. Precipitation was mostly above normal in the eastern half of the Nation, with the exception of a dry strip along the Gulf Coast and Florida. The Pacific Northwest was also wet, although much of the Midwest and Mountain area was deficient in precipitation.

March was cold over most of the Nation, with the exception of a band along the southern coast extending westward through southern Texas, thence northwestward across the southern mountain area into Idaho. Most of the Nation, except the southern Plains, received above average precipitation.

The outstanding event during April occurred the first week when a storm, worthy of midwinter, intensified over the Great Lakes to cause heavy snow and damaging winds in the Northeast. Heavy rains caused record flooding the second week in parts of the South. Later in the month flooding occurred in the north central States. April was a cold month everywhere in the Nation except southern Florida.

Following record low temperatures early in May, the weather turned warmer, and the month averaged warmer than normal over the eastern United States. The West, except for California and Washington, continued to experience cooler than average temperatures during May. Precipitation was abundant in the South, along the Appalachians, and much of the Rockies. The month was dry in New England and the central and northern Plains, as well as California.

June temperatures averaged close to normal in most areas, being a bit cooler than average in the southern Plains, the Rockies, and Appalachians, and slightly warmer than normal elsewhere. Heavy rain fell in parts of the Gulf Coast area, as well as parts of the Midwest. The Southwest was almost totally dry.

July continued to be wet along the Gulf Coast, as well as having ample rain in the Atlantic Coast States and in the Northwest quadrant. The month opened with serious flooding in the Red River Valley of the North. However, parts of the Great Plains suffered from dry weather. The temperature trend was generally warmer than average across the northern half of the Nation, cooler in the South in late July, extending into early August, extreme heat baked the Northeast.

With August long-awaited moisture came to the dry areas of the Plains, but too late to prevent some crop damage. The month was wet in the Northwest and the Great Lakes area southward along the Mississippi Valley area. The Southwest continued dry. Temperatures during the month generally ranged above normal from the Plains eastward and in the Southwest.

The big event during September was Hurricane Eloise, which caused heavy rain and serious flooding in many Eastern areas during the last week of the month. Much of the area affected was the same that suffered disastrous flooding in June 1972 from Agnes. The month was cooler than normal over most of the Nation except the west. During the second week, record lows were widespread. Other than the East and Southwest, the month was quite dry. Record dryness prevailed in the Northwest.

October, in sharp contrast to the previous month, brought record precipitation to many areas in the Northwest. New England was wet, too, while the Great Lakes and Plains were dry. Although monthly averages were close to normal, record low temperatures occurred the first week in many areas, followed by record highs later in the month. The first major winter storm of the season swept into the intermountain region on the 7th.

November was marked by heavy precipitation in the Great Plains, some of it occurring as blizzards. Rainfall continued heavy along the Northwest Coast.

GENERAL SUMMARY OF WEATHER CONDITIONS

YEAR 1975

In general, the eastern half of the Nation was above normal in temperature, with record warmth the first week, while the West was colder than average. The month ended with most of the country considerably colder than normal.

December was warmer than normal over most of the country, except the lower Southeast. Rainfall was deficient in the Midwest and Florida. Heavy rain early in the month in the Pacific Northwest caused serious flooding.

MAXIMUM SHORT DURATION PRECIPITATION

GENERAL SUMMARY OF TORNADOES, 1975

Henry Vigansky
National Oceanic and Atmospheric Administration
Environmental Data Service
National Climatic Center

The 1975 tornado season began on January 7 at 7:30 pm in Vermillion Parish, Louisiana. The tornado skipped across White Lake and hit the Union Oil Company dock at Little Prairie, injuring one person. The season ended on December 31 at 5:15 pm, in Durham County, near Durham, North Carolina. During the year a total of 918* tornadoes was reported on 204 days, killing 60 people, injuring 1,504 and causing total property damage in excess of 500 million dollars. Alaska, Idaho, New Hampshire, Puerto Rico, Rhode Island, Utah, Vermont, Virgin Islands, and Washington were the only areas to escape these devastating storms. Twenty-seven of the 918 storms were killer tornadoes.

During the year approximately 1,120 mobile homes were destroyed or damaged. Thirteen people died and 230 were injured in these mobile home disasters.

The following new records were established in 1975:

Month	State	New Record Number	Previous Record
January	United States	53	39 (1967)
	Alabama	13	5 (1974)
February	Florida	10	8 (1970)
	Oklahoma	6	4 (1961)
	New York	1	0
March	Mississippi	13	7 (1950)
	North Carolina	8	7 (1956)
	Virginia	4	2 (1969)
April	Florida	13	12 (1973)
	Louisiana	17	7 (1967)
May	Louisiana	12	10 (1950)
June	Montana	9	6 (1971)
	Virginia	4	2 (1969)
	West Virginia	2	1 (1973)
July	Maryland	6	2 (1971)
August	Delaware	2	1 (1967)
	Florida	13	8 (1974)
	Virginia	4	2 (1962)
September	Florida	9	7 (1967)
November	Iowa	9	3 (1960)
December	Iowa	1	0
	North Carolina	3	2 (1967)

* Two of these storms were border crossings.

GENERAL SUMMARY OF TORNADOES

Some of the more damaging tornadoes are described briefly in the following paragraphs:

JANUARY. Twenty-six tornadoes were reported on the tenth in Alabama, Louisiana, and Mississippi. The most devastating storm of the outbreak swept a path through Pike and Simpson Counties, Mississippi, killing nine people and injuring 210.

FEBRUARY. Six tornadoes did considerable damage on the 22nd in four southwestern Oklahoma counties; three persons lost their lives and 40 people were injured.

MARCH. A tornado touched down southwest of Warren, Arkansas, and moved to the center of the city before dissipating. Seven people were killed and 50 were injured. Property destruction was widespread with one major industrial area sustaining extensive damage. In addition, 151 buildings were destroyed, 100 sustained major damage and 200 encountered minor damage.

The "Governor's Tornado" in Atlanta, Georgia, did considerable damage to the Governor's Mansion, industrial areas, two apartment complexes, hundreds of homes and business establishments. This storm left 550 families homeless, three persons killed and 152 injured. Damage was estimated at $56.5 million.

APRIL. This month ranked first in the total number of tornado deaths this year: Louisiana 2, Missouri 5, Tennessee 3, and Texas 3.

MAY. The tornado season was in full swing this month with 188 tornadoes occurring on 30 days. Fifty of these storms occurred in Texas. Three tornadoes struck Omaha, Nebraska, on May 6 resulting in the worst tornado disaster there since Easter Sunday, 1913; three people were killed, 133 injured and damages were in excess of $0.4 billion.

JUNE. This month produced 196 tornadoes in 30 states. There were six deaths and 26 injuries. Tornadoes occurred on 26 days but none of them caused extensive damage. Florida, Illinois, Michigan, Nebraska, South Dakota, and Texas accounted for 107.

JULY. A marked decrease in tornado activity was noted in July. Seventy-six tornadoes occurred on 26 days. The outstanding tornado of the month struck Canton, Illinois, where total property loss was placed at $17-20 million. This was the first killer tornado in Illinois during the month of July since records have been kept. Two people were killed and 69 injured by this storm.

GENERAL SUMMARY OF TORNADOES

AUGUST-DECEMBER. In contrast to the previous seven months, tornadic activity was relatively light during this period. One hundred and sixty-eight tornadoes were reported causing 145 injuries and three deaths. On August 31 a man and his wife were killed near Nielsville, Minnesota; the other fatality occurred on New Year's Eve, near Ocala, Florida. Iowa had a total of nine tornadoes in November which exceeded the cumulative total of seven since 1916 for that month. The 1975 tornado season closed on New Year's Eve with two reported in Florida and three in North Carolina.

Additional information is presented in the following tables and charts. Several corrections have been made to previous totals through the continuing efforts of the National Severe Storms Forecast Center, State Climatologists, and the National Climatic Center. Changes from previous issues were applied to 1916-1974 data.

More detailed information about tornado activity can be obtained from the monthly Storm Data publications.

NORTH ATLANTIC TROPICAL CYCLONES, 1975

Paul J. Hebert
National Weather Service, NOAA
National Hurricane Center
Miami, Florida

The total of eight named tropical cyclones was below the past 30-year average of nine for the fourth consecutive year. However, the six that became hurricanes equalled the 30-year average and were the most in a single year since 1969. In addition, mariners had to contend with 26 hurricane days--the most since 1971--with the average intensity of the hurricanes also being the greatest since 1969. Figure 1 shows the tracks of the 1975 named tropical cyclones, and table 1 gives a statistical summary.

Hurricane Eloise was the most deadly and destructive Atlantic tropical cyclone of the season and the only one to make landfall in the United States. This was the fourth consecutive year with only one U. S. landfall of a named storm in contrast to a long-term average of over three. See table 3.

Three of the named storms (Amy, Doris, Hallie) exhibited subtropical characteristics during some part of their life cycle, but only Doris was designated a subtropical storm before being named. Figure 2 shows the tracks of the subtropical portion of Doris and a late season subtropical storm, and table 2 gives a statistical summary of the two storms. Since aerial reconnaissance was not available for these storms, winds in these systems were estimated by a new technique for satellite classification of subtropical storms.

TROPICAL STORM AMY, JUNE 26-JULY 4

Amy developed within a trough of low pressure which had persisted just off the southeast U. S. Coast for several days. The low-pressure system attained winds of gale force late on June 28 as the center was skirting the North Carolina Outer Banks. Winds gradually increased to a maximum of 60 kn on the 30th as the storm meandered slowly away from the U. S. mainland. It accelerated rapidly northeastward on July 3 passing some 150 mi southeast of Cape Race, Newfoundland, on the 4th while becoming extratropical.

During most of its life Amy had the characteristics of a subtropical storm. The region of maximum winds was well removed from the low-pressure center. The minimum central pressure of 981 mb occurred during this time. When winds reached gale force, however, data indicated it was more tropical than subtropical, so it was named Amy. Because of its close proximity to the coast, the name was retained throughout to avoid confusion in public releases. No attempt has been made to delineate the subtropical portions of this storm on the track charts.

HURRICANE BLANCHE, JULY 23-28

The depression which evolved into hurricane Blanche developed about 500 mi north of Hispaniola on July 23. It reached tropical storm strength, early on the 26th, while several hundred miles east of the U. S. mainland, as it was turning to the northeast ahead of an approaching cold front. However, the front weakened rapidly before cooler air could enter Blanche's circulation. Blanche reached hurricane strength during the early hours on the 27th. At this time the hurricane was at the same location crossed by tropical storm Amy 2 weeks earlier.

As high pressure built over the western Atlantic, Blanche turned toward the north-northeast, reaching its minimum central pressure of 980 mb and maximum sustained winds of 75 kn late on the 27th. The hurricane weakened only slightly before striking the southern tip of Nova Scotia on the morning of the 28th, becoming extratropical before reaching the Gulf of St. Lawrence at midday. Halifax, Nova Scotia, measured sustained winds of 45 kn with gusts of 70 kn and observed the "eye" of Blanche on radar. Damage was minor, and rainfall associated with Blanche was beneficial, ending a prolonged dry spell.

Gale warnings were issued from Rockland to Eastport, ME, at midnight on the 28th, with the Canadian Weather Service issuing a hurricane warning for Nova Scotia.

HURRICANE CAROLINE, AUGUST 24-SEPTEMBER 1

Caroline developed from a tropical disturbance which left Africa on August 15 with a closed-wind circulation first appearing when the center was about 200 mi north of Hispaniola on the 24th. The depression moved southwestward across eastern Cuba on the 25th. It gradually turned toward the west-northwest with no significant development during the next 3 days, moving into the Gulf of Mexico north of the Yucatan Peninsula by the 28th.

Satellite-determined cloud motions indicated the development of cirrus-level winds favorable for strengthening, and a reconnaissance plane found winds of tropical storm strength late on the 28th. Caroline reached hurricane force about 24 hours later and intensified rather rapidly beginning late on the 30th, as it moved steadily west-northwestward. Landfall was about 100 mi south of Brownsville, TX, on the morning of the 31st. The minimum central pressure of 963 mb and maximum sustained winds of 100 kn were reported by reconnaissance aircraft several hours prior to landfall.

A hurricane watch was issued for the Brownsville area on the morning of the 30th, with interests along the northeast Mexican coast advised of the likelihood of hurricane conditions within 24 hours. Winds gusted briefly to gale force at Brownsville, and an aerial survey revealed several small communities along the northeast Mexican coast destroyed or badly damaged.

HURRICANE DORIS (SUBTROPICAL STORM NO. 1)
AUGUST 28-SEPTEMBER 4

Hurricane Doris developed from a subtropical system in the mid-Atlantic. The initial low-pressure center developed from a frontal wave which formed, on August 27, near 31°N, 46°W. Satellite pictures showed the associated cloud mass was becoming more circular and detached from the front as the system deepened during the next 2 days. The HAHNENTOR reported gales, on the 28th and again on the 29th when the system was designated a subtropical storm.

Satelite pictures on the 30th indicated the system was becoming tropical, and that afternoon the BENSTAC, passing just south of the center, reported southwesterly winds of 60 kn and seas of 40 feet. The system was designated hurricane Doris late that day, and by the 31st a well-defined eye appeared on satellite pictures. The minimum central pressure of 965 mb and maximum sustained winds of 95 kn in Doris occurred on September 2 and were based on satellite photograph evaluation. The system's center had meandered westward, then eastward, and slowly northward during the 5-day period of August 28 to September 2. It was only 250 mi from its starting point on September 2. This slow movement, especially while Doris was a hurricane, enabled ships to easily avoid it; and no gale observations were received after August 31. On September 3, the hurricane moved northward ahead of a deepening low in the Canadian Maritime Provinces and lost all tropical characteristics early on the 4th.

HURRICANE ELOISE, SEPTEMBER 13-24

The disturbance from which Eloise formed left the African coast on September 6. The first sign that a depression had formed came, on the 13th, when the GULF HANSA reported northerly winds of 20 kn and seas of 10 feet.

Satellite pictures and ship and reconnaissance reports indicated slow intensification during the next 48 hours, and winds reached tropical storm strength early on the 16th. Eloise now intensified rapidly, and NOAA reconnaissance aircraft reported winds of minimal hurricane strength before it struck the northeastern coast of the Dominican Republic late that day. However, the main loss of life in Eloise resulted from flash floods caused by torrential rains over Puerto Rico, the Dominican Republic, and Haiti. Bulletins and advisories had warned of the impending disaster from the heavy rains more than 24 hours in advance. Fifty-nine deaths occurred in that area, with 34 in Puerto Rico; and damage was estimated at $60 million. Rainfall amounts of 10-20 inches were common over eastern and southwestern Puerto Rico with the maximum of 26.7 in near Sabana Grande in southwestern Puerto Rico.

The circulation of Eloise weakened considerably during the next 2 days as the center tracked westward across the mountainous terrain of Hispaniola and extreme eastern Cuba. By the 19th, Eloise was barely a tropical storm tracking westward toward the Yucatan Channel. Few Storms fail to intensify as they move through the Yucatan Channel into the Gulf of Mexico, and Eloise was no exception. An approaching upper-level trough in the westerlies caused Eloise to turn to the north after crossing the Yucatan Peninsula just north of Cozumel, Mexico. Eloise began a steady strengthening north of the Yucatan Peninsula, regaining hurricane force in the central Gulf of Mexico about 350 mi south of New Orleans on the morning of the 22d. Numerous ships were caught in gale-force winds as the hurricane grew in size and strength and moved through the main Gulf shipping lanes during the next 24 hours. However, the EXXON SAN FRANCISCO caught the brunt of Eloise's fury while passing through the center, on the 22d, as sustained winds reached 75 kn with gusts to 90 kn, and the pressure fell to 971.5 mb about 2300 on the 22d.

The center of Eloise passed within 17 mi of buoy EB04 with the western fringe of the eye over the buoy between 1300 and 1400. During this time, the buoys were reporting hourly. At 0300 on the 23d, the eye passed over EB10 with the center within 10 mi of the buoy. The minimum pressures recorded by the buoys were 986.7 mb at EB04 and 967.8 mb at EB10. The maximum winds were 52 kn (EB04) and 68 kn (EB10). The buoy EB10 reported a 29-feet significant wave height.

The hurricane continued strengthening until landfall about midway between Fort Waton Beach and Panama City, FL, shortly after 1200 on the 23d. It was the first direct hit by a major hurricane in that area in the 20th century! As Eloise moved inland over eastern Alabama at a forward speed of 25 kn, cooler air was drawn into its circulation, and it weakened to a tropical depression over extreme eastern Tennessee only 12 hours after landfall.

The lowest pressure of 955 mb was observed at Destin, FL. Maximum sustained winds were estimated at 110 kn. However, the highest sustained winds along the coast went unmeasured because of the sparseness of observing stations and the failure of wind measuring equipment. A sustained wind near 80 kn with a gust to 135 kn was measured on a 98-feet tower located 13 mi offshore from Panama City. Winds of hurricane force were reported from Fort Walton Beach to Panama City and northward into extreme southeastern Alabama. Gales were reported from the southeastern Louisiana Delta and New Orleans area to Cedar Key, FL, and northward over most of Alabama and western Georgia into extreme southeastern Tennessee.

Rainfall amounts ranged from 4 to 8 inches from extreme southeastern Louisiana to the Panama City area and over extreme western portions of the Carolinas. The greatest storm total was 14.9 inches at Eglin Air Force Base in Valparaiso.

Measurements of high-water marks by the U. S. Corps of Engineers, Mobile District, indicate hurricane tides of 12 to 16 feet above mean sea level occurred from just east of Fort Walton Beach to south of Panama City. The highest inside high-water mark of 18.2 feet occurred near Dune Allen Beach. Reports indicate that at least ten tornadoes occurred from northwestern Florida to western North Carolina, causing minor damage and no deaths. Table 1 summarizes the significant meteorological data. Measurements are given in the units in which they were reported.

By late on the 24th, Eloise's remnants were no longer identifiable. However, the combination of the moisture brought northward by Eloise and a stagnant frontal zone produced rainfall amounts of 5 inches or more over eastern Virginia, extreme eastern West Virginia, Maryland, New Jersey, eastern Pennsylvania, and southern New York State. Storm totals exceeded 10 inches along some of the eastern mountain slopes, triggering major flooding on the Chemung, Susquehannah, Potomac, and Shenandoah Rivers.

The combined effects of winds and tides undermined or demolished numerous structures along the beach strip from Fort Walton to Panama City. Losses will probably exceed $100 million. Four deaths were indirectly attributed to Eloise. Damaging winds over eastern Alabama caused extensive damage to property and crops with losses estimated near $100 million. Over the northeastern U. S., flooding damage was estimated at about $400 million with 15 deaths, most of which were drownings.

HURRICANE FAYE, SEPTEMBER 18-29

Satellite pictures first indicated the formation of the depression which developed into Faye about 500 mi west of the Cape Verde Islands of September 18. On the 19th, ship reports from the LEMPA indicated the depression had strengthened to a tropical storm. Faye moved steadily westward with little change in strength until the 23d at which time unfavorable cirrus-level winds caused the storm to weaken to a depression. The depression drifted northward and then westward during the next 48 hours. Cirrus-level winds became more favorable by the 25th, and Faye regained tropical storm and then hurricane strength while beginning a northwesterly course that would contunue until the 27th.

The center passed just east of Bermuda on the evening of the 26th, but damage on the Island was minor since it remained on the weak side of the hurricane. Earlier that day the BLEXEN sent a plain language message indicating the ship was very close to the center and experiencing 90-kn winds and 35-feet seas. Meanwhile, the ELSFLETH reported 35-kn gales throughout the day while heading north-northeastward and probably unaware that 48 hours later the ship would meet Faye again and endure 62-kn winds and 38-feet seas as the hurricane recurved and accelerated east-northeastward.

Faye lost tropical characteristics on the 29th but still packed plenty of punch as the SYLVO, which had earlier battled Amy, reported 55-kn winds while located about 200 mi west of the Azores. The lowest pressure reported in Faye was 977 mb and the highest wind 90 kn.

HURRICANE GLADYS, SEPTEMBER 22-OCTOBER 3

The disturbance from which Gladys evolved followed the one from which Faye formed by about 4 days. Faye took a more northerly track along latitude 20°N, while Gladys followed to the southeast along latitude 11°N. Like Faye, Gladys reached tropical depression status near longitude 35°W and tropical storm strength near longitude 40°W. However, Gladys was able to reach hurricane intensity before encountering the same unfavorable conditions that Faye had between 45°-55°W.

After weakening to a marginal hurricane by the 28th, Gladys began intensifying while following a rather typical track around the Atlantic subtropical ridge. As the hurricane turned to a northerly track slightly sooner than anticipated on October 1, the MARCONA TRADER and CORNELIA MAERSK reported hurricane-force winds of 70 kn and 64 kn, respectively. Twenty-four hours later at 1800 on the 2d, the UNION SUNRISE reported southerly winds of 60 kn as reconnaissance aircraft measured a central pressure of 939 mb and 120-kn winds about 300 mi east of Cape Hatteras, NC. This is one of the lowest recorded pressures in a hurricane that far north.

Gladys turned toward the northeast and accelerated on the 2d, moving at a forward speed of better than 45 kn, as it passed about 70 mi off Cape Race, Newfoundland, around daybreak on the 3d. Widespread gales covered the western Atlantic as Gladys merged with a strong cold front.

TROPICAL STORM HALLIE, OCTOBER 24-27

Hallie developed from a subtropical depression which had originated on October 24 in an old frontal zone off the Florida East Coast. The depression moved slowly northward parallel to and within 100 mi of the Florida and Georgia coastline, gradually acquiring tropical characteristics during this time. It reached tropical storm strength about 100 mi east of Charleston, SC, on October 26. The storm turned northeastward that evening, reaching maximum intensity of 45 kn and minimum pressure of 1002 mb while skirting the North Carolina Outer Banks. Gale warnings were issued for the outer banks, but the area remained on the weak side of the storm. However, a severe thunderstorm caused wind gusts estimated in excess of hurricane force at Frying Pan Lightship. Hallie merged with a frontal zone and became extratropical late on the 27th.

SUBTROPICAL STORM NO. 2, DECEMBER 9-13

A late season storm which evolved from an extratropical storm in the north central Atlantic exhibited characteristics of a subtropical system by December 9. The storm followed a rather unusual track, moving southward at 25 kn, between the 10th and 11th, before curving eastward and weakening rapidly on the 12th. An unidentified ship reported northwesterly winds of 60 kn as the low intensified on the 10th. The HAHNENTOR had the rather dubious distinction of encountering Subtropical Storm No. 2 at almost the exact spot where the ship had run into Subtropical Storm No. 1 (Doris) 3-1/2 months earlier!

Table 1. - Summary of North Atlantic Tropical Cyclone Statistics, 1975

Storm Name	Intensity	Date	Maximum Sustained Winds (kn)	Lowest Pressure (mb)	U.S. Damage ($ Millions)	Deaths

**The Environmental Data Service has for some time recognized that, without detailed expert appraisal of damage, all figures published are merely approximations. Since errors in dollar estimates vary in proportion of the total damage, storms are placed in categories varying from 1 to 9 as follows:

1 Less than $50	4 $5,000 to $50,000	7 $5,000,000 to $50,000,000
2 $50 to $500	5 $50,000 to $500,000	8 $50,000,000 to $500,000,000
3 $500 to $5,000	6 $500,000 to $5,000,000	9 $500,000,000 to $5,000,000,000

*Including hurricanes

# Not reported in literature, believed minor.

TROPICAL CYCLONES IN THE EASTERN NORTH PACIFIC, 1975

Robert A. Baum
Eastern Pacific Hurricane Center, NOAA
San Francisco, Calif.

Tropical cyclone activity over the Eastern North Pacific in 1975 began June 2 and continued through November 7. It was a nearly normal season with 16 named storms and 4 tropical depressions. Of the named storms, eight developed to hurricane intensity. Table 1 shows the monthly distribution of the cyclone activity.

Advisories were issued on 87 days of the season--243 marine and military and 65 aviation advisories for tropical storms and hurricanes and 130 bulletins for tropical depressions. The distribution of cyclone activity was quite even, with only 4 days with three cyclones in progress at the same time and 19 days with two cyclones. When cyclones were in progress, bulletins or advisories were issued four times daily for each, at 6-hour intervals, 3 hr after synoptic chart times of 0000, 0600, 1200, and 1800. Amendments were issued five times during the season for changes in intensity of storms.

A comparison with cyclone activity in the recent past is shown in tables 2 and 3. The 1966-1975 period probably includes all tropical cyclone activity in the area because of the excellent satellite picture coverage during that time. Prior to 1966, cyclone occurrence was probably undetected due to the sparsity of data.

Two Air Force reconnaissance flights were accomplished--one into Agatha on June 5 and one into Olivia on October 24.

Satellite imagery supplied most of the cyclone fix and intensity data for the bulletins and advisories. Pictures at 30-min intervals from SMS-2 (Synchronous Meteorological Satellite) with full disk resolution of 4 mi and sector resolution of 2 mi gave excellent details. Intensity was calculated using the Dvorak method (Mariners Weather Log, Vol. 19, No. 4). The stability of the satellite over the Equator and good land marks make gridding of pictures accurate to within a few miles over the primary cyclone area. This resulted in accurate placement when typical features were visible. When storm development was poor, greater accuracy was available from the visible spectrum pictures than from the infrared. Greatest inaccuracies in intensity and location were experienced using infrared pictures when the cirrus shield over the cyclone was displaced from the surface circulation. This situation affected position accuracy enough to require relocation of storms eight times during the season, two of which were successive positions of tolerance indicated in the previous bulletin.

Infrared pictures were made into movie loops. The process consisted of making three exposures of each 30-min interval picture, or 44 pictures daily. Pictures were not available for 2 hr each day because of routine maintenance programs. The movie loop gave a running time of about 10 sec for the 22-hr period. It showed the progress of the storm or suspected area as well as any change in intensity. Direction and speed as well as development could be watched as the loop repeatedly fed through the projector. Loops were prepared four times daily and were available before bulletins and advisories were issued.

When storms were near the Mexican coast, merchant vessel reports were extremely valuable in helping to locate them, but only peripheral reports were received. Hopefully, this was because of the value and use of advisories and bulletins. Elsewhere, off the major shipping routes, vessels were seldom within 300 mi of the cyclone centers.

The storm tracks are shown in figures 1 and 2.

The only reported casualties were from hurricane Olivia. Tropical storm Eleanor moved onshore about 30 mi southeast of Manzanillo with 35-kn winds during the evening of July 11. Hurricanes Katrina and Lily passed a few miles southwest of Socorro Island--Katrina on September 2 with 90-kn winds, and Lily on September 18 with 75-kn winds. No reports of casualties or damage have been received.

Hurricane Olivia moved onshore near Mazatlan during the evening of October 24. Thirty thousand people were made homeless in the loss of 7,000 dwellings in Mazatlan and 14 nearby villages. Five hundred people were injured and 10 killed on shore. An additional 20 persons were lost on three shrimp boats that apparently were overwhelmed by the storm. A total of 50,000 people were removed in military vehicles from low-lying areas in and around Mazatlan before the storm hit, indicating the effectiveness of the forecasts.

The tuna boat BLUE PACIFIC encountered Olivia as she developed hurricane intensity. Some deck equipment was swept overboard or damaged by heavy seas, but when the storm passed, she was able to continue fishing.

No reports of damage to merchant vessels or their cargo have been received. A summary of the salient features of the 1975 season is included in table 4.

Reconnaissance flights contributed to the overall observation program. The June 5 flight into Agatha confirmed the fact that she was weakening. The October 24 flight into Olivia was a great help in determining the course, speed, and intensity of that hurricane.

HURRICANE AGATHA, June 2-5

A number of tropical disturbances were charted in the eastern North Pacific Ocean during the last 2 wk of May, but the areas of squalls and thunderstorms would build, die, and rebuild several hundred miles from the initial point on successive days.

An area about 250 mi southwest of Acapulco showed signs of greater instability than the others on June 1. Windspeeds of 25 kn were reported by the PRESIDENT JEFFERSON at 15.1°N, 97.3°W, at 1800. At 0000 on the 2d, the SHUNYO MARU reported an east-south-easterly 25-kn wind and a 1005.4-mb pressure in the same area. No other vessels reported in the area, but the 2345 SMS-2 photograph indicated a tropical depression with 30-kn winds, close to 13.5°N, 99°W. Film loops showed its movement to be toward the west-southwest at 12 kn. The LOW was forecast to curve westward and then northwestward, and to intensify.

When the depression reached its southernmost point, near 13.1°N, 100.4°W, at 0600 on the 3d, it increased to tropical storm intensity with 35-kn winds and was named Agatha. Further intensification took place, with winds increasing about 5 kn each 6 hr through 1800 on the 3d, during which time the storm traveled on a northwesterly course at a speed of about 10 kn. A satellite picture at 2116 showed development to hurricane intensity near 15.4°N, 103.7°W, about 150 mi southwest of Zihuatanejo, with 65-kn winds and gales out to 250 mi in the northeast quadrant and 125 mi elsewhere.

The strongest winds suggested by satellite pictures were 70 kn at 0000 on the 4th. The hurricane continued into the night but decreased to tropical storm strength at 1200. An apparent jog in the track was the result of difference in the location of the center between nighttime infrared and daytime visible-spectrum pictures.

After analyzing all the data and forming the "most probable track" of the storm, it was decided that the northeasterly movement was probably indicated as a result of a slight error in the storm's location at 0600 and 1200 on the 4th. These errors were translated to the forecast which then paced the storm onshore near Puerto Vallarta, about 0600 on the 6th. At 1800 on the 4th, a new track was developed with the storm continuing northwestward from near 18°N, 105°W.

Agatha weakened to a tropical depression at 1200 on the 5th. At 1800, the center was analyzed at 19.2°N, 106.4°W, based on 20- to 25-kn winds reported by the J. V. CLYNE, the MELVILLE, and the NORDIC HERON. The storm dissipated about 120 mi south of the Tres Marias Islands.

TROPICAL STORM BRIDGET, June 27 - July 3

A tropical depression developed about 500 mi south of the tip of Baja California, well west of the usual area of formation for tropical cyclones, at 1800 on June 27.

As usual, initial movement of the depression was uncertain, but a general westerly direction was followed at a speed of 6 kn for the first 12 hr. When the depression intensified to tropical storm Bridget, near 15°N, 111°W, at 1200 on the 28th, its course changed to northwesterly, and the speed increased to 8 to 10 kn. This movement continued as gradual intensification took place. The KOPAA, heading southeastward, sailed southwest and south of the center, on the morning of the 29th, when Bridget had 50-kn winds. The highest windspeed the KOPAA reported was 25 kn at 1800 on the 29th and at 0000 on the 30th.

Bridget changed to a westerly course at 17.3°N, 115°W, after the KOPAA passed, and then southwesterly, approaching no other vessel as a storm. The CHAOMING outran the storm westbound on July 1 and 2, reporting regularly as she traveled.

At 0600 on the 2d, Bridget became a depression near 15°N, 120°W, with 30-kn winds. Continued cloudiness, somewhat supported by reports from fishing vessels in the area, indicated that a circulation remained for several days near 14.4°N, 122.5°W, but there were insufficient data to warrant upgrading the circulation to tropical depression status.

HURRICANE CARLOTTA, July 2-11

As tropical storm Bridget passed 100 mi south of Clarion Island, headed west-southwestward, an area of squalls and thunderstorms began developing 420 mi south-southeast of Acapulco. The cloudiness was moving west at about 10 kn and was indicated in high-seas bulletins to develop as a tropical cyclone. Special bulletins were begun at 0600 on the 2d for tropical depression Three which was forecast to become a tropical storm in 24 hr. The KOPAA reported 25-kn winds in squalls 130 mi north of the center at 0900 on the 2d and 35-kn winds 150 mi northeast of the center at 1500. This report suggested that the depression had intensified to tropical storm

Further intensification was almost in textbook style. The storm was moving toward the west-northwest and northwest at 10 to 12 kn, becoming a hurricane with 65-kn winds near 12.5°N, 108.2°W, by 1800 on the 3d, and with 100- to 110-kn winds from 0000 on the 5th at 15.8°N, 111.7°W, through 1800 on the 6th at 17.3°N, 117.9°W.

Weakening began about 0600 on the 6th, but the ERIDGE reported south-southwesterly winds of 45 kn, 200 mi southeast of the center, at 1200 on the 7th, when the hurricane still contained winds of 75 kn. Tropical storm intensity began at 0000 on the 8th with 35-kn winds.

The SHINYU MARU and the DAISHIN MARU reported well south of the center at 0000 and 0600 on the 8th, but these reports indicated no more than a storm at some distance to the northwest.

The KRAIGHER B passed 120 mi north of Carlotta, at 0900 on the 9th, and had 30-kn winds until about 200 mi east of the center. She then altered course to pass south of oncoming Denise, 900 mi east-northeast of Carlotta.

Carlotta became a depression at 0000 on the 10th. The CHEVRON AMSTERDAM overtook the weakening depression during the night of the 10th, 180 mi south of the center.

HURRICANE DENISE, July 4-15

No other vessels were near the center of a large unstable area, near 11°N, 93°W, at 1800 on the 4th, but reports from the AMERICAN LANCER, CHEVRON AMSTERDAM, KOPAA, and SAN JUAN EXPORTER indicated a circulation had developed. The depression was followed west and northwestward on satellite pictures and charted as a tropical depression with the aid of peripheral reports from the AMERICAN LEADER, ASTRID BAKKE, CEDARBANK, CHEVRON AMSTERDAM, MARITIME JET, RICE QUEEN, SANTA MAGDALENA, and the UNIWERSYTEL WARZAWSK, through 1800 on the 6th, near 13°N, 101°W.

At 0000 on the 7th, the depression intensified to tropical storm Denise, with 45-kn winds reported by PGXY, 30-kn winds by the EURYBATES, and 20-kn winds by the PRUD OCEANJET. As the storm reached 15°N, 103°W (200 mi south of Manzanillo), at 0000 on the 8th, its course changed to more westerly. At this time the storm was considered a hurricane. Although winds along the coast, from Cape Corientes to Acapulco, are normally strong southeasterlies under these circumstances, they were reported as only 15 to 25 kn. The hurricane steadily increased in intensity to 120 kn, by 1200 on the 9th, with the strongest reported winds of only 30 kn by the PLEIAS and the FIDELITY R at 1800 on the 9th. The course of the hurricane then changed to southwesterly, and it weakened slowly. The PSDY sent a SHRED report of northwesterly winds of 45 kn from 150 mi west of the center at 0000 on the 10th. The storm continued southwestward, slowly weakening and becoming nearly stationary, from 1800 on the 10th to 0600 on the 11th, near 13.7°N, 113.5°W. After the 12-hr "stationary" period, Denise began moving northwestward at about 10 kn.

At 1800 on the 11th, the CABRILLO, a tuna boat just off Clarion Island, was headed southwestward as Denise, with 80-kn winds some 200 mi to the south, was moving northwestward. The CABRILLO, aware of the location and intensity of the storm, contacted the Hurricane Center for information and advice. The storm and boat were on an intercept course with the meeting scheduled for 0500 on the 12th. The advice was to sail east for 6 to 12 hr and then resume the southwesterly course. The CABRILLO reports regularly in the Tuna Fleet and is an old hand at evading tropical cyclones.

At 0000 on the 12th, the CETRA LYRA was about 100 mi east of the hurricane and moving northwestward at about the same speed as Denise. She reported 40-kn winds. These increased to 60 kn, by 0000 on the 13th, when the CETRA LYRA reported the lowest pressure in the storm--993 mb. She altered her course to pass 120 mi south of the center, at 1800 on the 13th, with 30- to 40-kn winds.

By the time Denise reached 19.7°N, 118.7°W, she had weakened to tropical storm intensity, and she became a depression near 20.6°N, 119.2°W, at 1800 on the 14th, and dissipated 6 hr later.

TROPICAL STORM ELEANOR, July 10-12

A persistent area of thunderstorms 120 mi south of Acapulco, at 1800 on the 10th, led to issuing a bulletin on tropical depression Six. Movie loops of satellite pictures showed cyclonic circulation with signs of intensification, so the depression was upgraded to tropical storm Eleanor. Acapulco reported 30-kn winds, at 1200 and again at 1800 on the 10th, but vessels reporting in the area were not numerous enough to pinpoint the location of the center.

Eleanor moved north-northwestward for 6 hr, northward for 18 hr, and then northward to go onshore near Manzanillo, at about 0500 on the 12th. At 0000, the LUDWIGSHAFEN reported a 998.6-mb pressure about 75 mi southeast of the center, and the FERNFIELD reported 30-kn winds 30 mi south of the center. Manzanillo reported westerly 15-kn winds 20 mi northwest of the center.

No damage was reported to vessels, and it is not believed rainfall was heavy enough to cause more than minor damage to shore installations.

TROPICAL STORM FRANCENE, July 27-30

Tropical storm Francene began as a disturbance near 11.5°N, 95°W, about 1200 on July 25, moving northwestward at 20 kn, with winds of 30 kn in squalls. The disturbance continued on a northwesterly track but slowed as it organized and intensified to tropical depression Seven, at 0600 on the 27th, near 16.4°N, 102.8°W. The track became more westerly, and the depression developed to tropical storm Francene near 16.5°N, 103.7°W, at 1200 on the 27th. A westerly movement continued for 24 hr when Francene weakened to a depression. The depression curved northwestward, and its speed increased to 15 kn as weakening continued. By 0000 on the 30th, only a minor circulation was indicated in satellite pictures, so bulletins were discontinued. A tropical disturbance was indicated in high-seas bulletins for another 12 hr; then even these were dropped.

TROPICAL STORM GEORGETTE, August 10-13

Georgette began as a tropical depression about 700 mi southwest of Cape San Lucas, late on August 10. She was headed westward at about 5 kn with 25-kn winds. Tropical storm intensity was reached 24 hr later, at 1800 on the 11th, near 14.4°N, 119.5°W, where the course curved gently northward, and the speed increased to 8 to 10 kn. Maximum winds of 40 kn were indicated from 0600 on the 12th to 0000 on the 13th, when slow weakening began.

The track then curved westward again with forward speed of 10 to 12 kn. When the storm reached 17.4°N, 125.3°W, at 0600 on the 13th, the intensity dropped to depression stage. Further weakening continued through 0600 on the 14th, when bulletins were discontinued.

No reporting vessels approached nearer than 300 mi of the cyclone.

TROPICAL STORM HILARY, August 12-17

The gradual organization of a tropical disturbance, near 11°N, 103°W, was noticed in satellite pictures on August 11. A circulation had developed by 1800 on the 12th. It was moving west-northwestward at 8 to 10 kn, and tropical depression Nine formed near 11.4°N, 107°W, with 30-kn winds in squalls and thunderstorms near the center.

The depression increased to tropical storm intensity and was named Hilary at 0600 on the 13th. Winds of 40 kn were estimated from satellite pictures, and the center, moving northwest at 10 kn, was indicated near 12°N, 109.5°W. The northwesterly movement continued, and its forward speed increased to 14 kn as winds near the center increased to 50 kn, at 0000 on the 15th, near 16.5°N, 116°W.

Weakening followed the northwestward acceleration, with the center reaching 20.3°N, 121.7°W, at 1200 on the 16th, when the storm became a depression with 30-kn winds. The center began curving west-northwestward as weakening continued. Dissipation was near 21°N, 124°W, at 1200 on the 17th.

Gale winds were reported by an unidentified vessel with 1007-mb pressure about 100 mi northwest of the center, at 0000 on the 13th, while the cyclone was still classified as a depression. The GALILEO GALILEI, 150 mi south of the center, reported 15-kn winds at 0600 on the 13th. No other vessels reported within the circulation of the cyclone.

HURRICANE ILSA, August 18-26

A disturbance that apparently crossed Central America between 8° and 13°N was followed west-northwestward from near 7°N, 83°W, beginning August 16. It was moving at about 20 kn, and a weak circulation was suggested by reports from the AMERICAN AQUARIUS and the DEVON CITY. Reports from the RIGOLETTO and DEVON CITY, at 1800, indicated it had had moved to 9°N, 89°W, but the windspeeds reported reported were only 5 to 10 kn. By 1200 on the 17th, the disturbance was indicated by satellite pictures to be near 12°N, 94°W, and the windspeeds had increased to 10 to 20 kn at points 100 to 150 mi of the center of the shower and thunderstorm activity. Six hours later, the PORTMAR AND ELISABETH BOLTEN added their reports indicating further intensification.

By 0000 on the 18th, reports from the UNIQUE FORTUNE indicated that tropical depression Ten had formed near 12.1°N, 95.8°W, and was moving west-northwestward at about 8 kn. By 1200 on the 18th, the depression had intensified to tropical storm Ilsa, near 12.3°N, 97°W. Movement continued west-northwestward 10 kn, but a more westerly track was was observed as intensification took place. The storm became a hurricane near 14°N, 104°W, at 0000 on the 21st, on a course of 280° at 9 kn.

Intensification continued with winds reaching 85 to 95 kn from 1200 on the 22d through 0600 on the 25th. Ship reports were few. A Chinese vessel reported 30- to 40-kn winds as it passed 200 mi south of the center on the 23d.

The track curved northwestward at 10 kn, from 1800 on the 22d through 1800 on the 24th, then westward again. Weakening began at 0600 on the 25th and was rapid. Ilsa became a tropical storm near 19.7°N, 126.1°W, at 0000 on the 26th, and a depression by 1800 near 20.3°N, 129.9°W.

The remnants of Ilsa were followed westward in satellite pictures and with the aid of reports from the AVOCET, CHAO MING, HAWAIIAN MONARCH, MALLORY LYKES, MATSONIA, ORONSAY, PRINCE MARU No. 7, SHOZEN MARU, and the SILVEROON to near 29°N, 153°W, by 1800 on the 31st, but no reports were for more than 25-kn winds.

Tropical storm appearance began again on September 3 when VHRR (Very High Resolution Radiometer) pictures showed an intense circulation, complete with an eye, near 38°N, 158°W, and 35-kn winds were reported by the HAGOROMO MARU at 1800, 45-kn winds by the PLUVIUS, and 35-kn winds by the TRANSCOLORADO at 0000 on the 4th. At 0600 on the 4th, 55-kn winds were reported by the TRANSCOLORADO. The LOW moved northeastward and dissipated in the Gulf of Alaska.

HURRICANE JEWEL, August 23-31

While Ilsa was churning her way northwestward, 400 mi southwest of Cape San Lucas, a tropical disturbance formed about 300 mi south of Acapulco. Initial reports from the PRUD OCEANJET and the KRYPTOS indicated winds to 30 kn in squalls, at 1800 on the 23d, and suggested tropical depression Eleven had formed. The depression was moving west-northwestward at 12 kn, but slowed to about 5 kn by 1800 on the 25th, forming tropical storm Jewel during the deceleration.

The course changed to westerly at 5 to 8 kn, and intensified to a marginal hurricane by 1200 on the 27th. Slow weakening and acceleration west-northwestward continued, through 0000 on the 31st, to tropical depression strength near 19°N, 126.2°W. Bulletins on the depression were discontinued after 1200 on the 31st, but remnants of the circulation were still visible in satellite pictures until September 3.

TROPICAL CYCLONES IN THE EASTERN NORTH PACIFIC

HURRICANE KATRINA, August 28 - September 7

Tropical storm Jewel was working her way westward some 400 mi southwest of Cape San Lucas, and Ilsa was a tropical depression 1,000 mi each of Honolulu, at 1800 on the 28th, when a rapidly developing tropical depression formed 400 mi south of Acapulco. Successive satellite pictures of Katrina indicated a west-northwesterly 10-kn movement, and hurricane intensity was forecast within 48 hr, but was reached sooner, at 1800 on the 29th, near 11.5°, 103.7°W.

The track of Katrina turned more northwesterly, and gradual intensification continued. Winds of 80 kn were indicated when the center was 150 mi southeast of Socorro Island at 1200 on September 1, and 115 kn when the center was 180 mi northeast of Socorro Island at 1200 on the 3d.

Following the peak intensity, at 1200 on the 3d, weakening began, and the course became westerly. The hurricane was downgraded to a tropical storm, at 0600 on the 5th, near 21.8°N, 121.1°W. Dissipation was almost as rapid as its earlier development. Tropical depression stage was reached, by 1200 on the 6th, and bulletins were discontinued at 0000 on the 7th.

HURRICANE LILY, September 15-21

Rain and easterly wind at Acapulco, at 1200 on September 15, suggested a tropical disturbance offshore. The 1800 reports from the DEVON CITY, MARITIME ACE, and JOHAN U verified a circulation center near 16°N, 102°W, moving westward at 10 kn, and forecast to be a tropical storm within 24 hr. It took only 18.

Satellite pictures included enough features to consider Lily a tropical storm about 150 mi south of Manzanillo, by 1800 on the 16th, with winds estimated at 35 kn. Soon after forming, Lily curved slightly northwestward, slowed to about 5 kn for 30 hr, and increased in intensity to 50 kn, by 0000 on the 18th, 200 mi southwest of Manzanillo.

A west-northwesterly track continued with no surface vessels reporting near the storm. At 1800 on the 18th, Socorro Island reported a northeasterly wind of 30 kn. When the center was 60 to 75 mi to the southeast, Lily was upgraded to a hurricane.

Socorro Island reported easterly winds which increased to 70 kn, by 0000 on the 19th, as Lily passed to the south and west of the Island. The storm was then moving west-northwestward at about 12 kn.

That track continued as the hurricane slowly weakened to a tropical storm with 60-kn winds, at 1200 on the 20th, and to a tropical depression with 25-kn winds, 24 hr later, near 22.5°N, 126°W. The remains of Lily drifted west-southwestward in the northeast trades, and all traces of her were lost by the 24th.

TROPICAL STORM MONICA
September 28 - October 2

Three tropical disturbances were indicated in satellite pictures at 1800 on September 27. They were centered near 13°N, 125°W; 11°N, 115°W; and 14°N, 106°W; and were moving westward at 10 kn. The disturbance that was initially near 125°W dissipated by 0600 on the 28th. The IRISH MAPLE, at 11°N, 114°W, at 0000 on the 28th, reported southwesterly winds of 10 kn and, slowly closing on the disturbance, reported southwesterly winds of 15 kn about 75 mi from the center of activity, which was estimated near 12°N, 117°W, at 0600. The IRISH MAPLE's pressure had been falling at a rate of 1 mb per hr, and the wind had increased to 40 kn by 1800, indicating tropical storm Monica had formed.

The storm continued tracking westward at about 12 kn, passing near the OCEANOGRAPHER at 0600 on the 29th. The IRISH MAPLE reported 30-kn winds about 100 mi from the center, near 12.3°N, 123°W, at 1800 on the 29th, as Monica continued to travel on a course a little north of west. The strongest wind in the storm was 45 kn indicated by satellite pictures, at 1800, near 13°N, 123°W.

Monica continued westward to 13.9°N, 126.5°W, by 0600 on October 1, when she was downgraded to a depression, and bulletins were discontinued. The disturbance continued westward giving the WESER heavy rain and 25-kn winds on the 2d.

After that, the remains could be seen in pictures as the disturbance moved to 17°N, 140°W, by 1800 on the 6th. The KISHU MARU, NECTARINE CORE, and PHILIPPINE BEAR reported near the cloud cover but suggested no circulation in their observations.

TROPICAL STORM NANETTE
September 28 - October 4

The easternmost tropical depression, near 14°N, 106°W, at 1800 on September 27, was relocated farther south near 12.8°N, 107°W, at 1200 on the 28th. It moved generally westward at 8 to 10 kn and increased in intensity to become tropical storm Nanette, near 12.8°N, 110.1°W, while slowing slightly and curving a little south of west.

The southernmost point in the track was reached, at 1200 on the 30th, near 12.2°N, 111.8°W, after which a northwesterly and westerly track at about 10 kn continued through 0600 on October 3. Gradual intensification continued to 45 kn at 1800 on October 1 through 0600 on the 3d.

Weakening was as slow as the generation. Winds of 40 kn continued near the center until 0600 on the 3d, at 15°N, 122.5°W, when a southwesterly track began. By 0000 on the 4th, the storm became a disturbance, near 14°N, 125°W, and bulletins were discontinued.

No vessels were near enough to the storm to report any significant weather. If it were not for satellite pictures, it is doubtful that Nanette would have been detected.

HURRICANE OLIVIA, October 22-25

Satellite pictures showed three areas of concentrated thunderstorm activity, near 13°N, 106°W, early on October 21. By afternoon, the PORTUGAL MARU and SAPPORO MARU with 1006-mb pressures, 120 and 200 mi from the center, suggested a circulation had formed. By 0600 on the 22d, tropical storm intensity was indicated in high-seas bulletins and advisories.

Further development was slow, and its movement was toward the northwest at about 12 kn to near 15°N, 111°W, by 1800 on the 22d. The circulation was well developed as indicated by reports from the PORTUGAL MARU, SAPPORO MARU, OCEAN HAPPINESS, and Socorro Island, all about 200 mi from the center. The storm was forecast to move west-northwestward and to intensify. By 0000 on the 23d, it became apparent that the track was more northerly, and a vessel reported east-southeasterly 60-kn winds at 1800, at 16.8°N, 109.7°W, about 75 mi northeast of the center.

The tuna boat, BLUE PACIFIC, ran afoul of Olivia near 17°N, 110°W, at 0000 on the 24th, and reported 75-kn winds with gusts to 90 kn and the loss of much deck equipment from heavy seas.

The hurricane continued curving northeastward and began to accelerate. Air Force reconnaissance, at 1322 on the 24th, reported southeasterly 79-kn winds at 9,200 ft in the southeast wall of the elliptical eye near 20°N, 109.6°W.

Northeasterly movement of the hurricane became stable at about 12 kn. The CUFIC and a Mexican Coast Guard boat reported 50-kn winds some distance from the center, as the hurricane moved toward the coast during the afternoon of the 24th.

The hurricane moved onshore, between 0400 and 0500, a few miles south of Mazatlan on the 25th. Newspaper reports indicated 50,000 people were evacuated from low-lying areas before the hurricane struck; 30,000 people were left homeless by the destruction of 7,000 dwellings in or near Mazatlan; 500 were injured and 30 killed as a result of heavy rains and 138 mi/hr winds. Twenty of the fatalities were crewmen of three shrimp boats which were lost. Monetary losses have been tentatively set at $20 million, of which $4 million was in beach and tourist areas.

Ship reports and satellite pictures made possible the positive forecasting of the storm during the 18 hr prior to its moving onshore. While damage and suffering were considerable, without the early warning, they would have been greater.

TROPICAL STORM PRISCILLA, November 2-7

A portion of a cloud mass that crossed Honduras and Guatemala during the last week in October began to organize near 11°N, 97°W. As best as could be determined this mass of clouds remained stationary for about 18 hr, then drifted slowly north for 12 hr, gradually increasing in intensity to a depression with 30-kn winds.

As soon as a circulation was well established, the depression moved west-northwestward becoming tropical storm Priscilla, at 13.2°N, 101.6°W, at about 0600 on the 4th. The track continued in the same direction, passing 120 mi northeast of the ABEL TAS-MAN, at 0000 on the 5th, and continued to 15.3°N, 105.6°W, with 45-kn winds by 0600 on the 5th.

The storm was forecast to continue northwestward and then curve northward, but recurvature never occurred. After 0600 on the 5th, a more westerly track developed and winds of 55 kn were estimated from satellite pictures.

The SOUTHWEST CAPE reported northerly 30-kn winds 75 to 80 mi west of the center, which was near 15.6°N, 110.3°W, at 0000 on the 6th. The storm then headed northwestward, toward Clarion Island, but dissipated 100 mi short of landfall at 0000 on the 7th.

TYPHOONS OF THE WESTERN NORTH PACIFIC, 1975

Captain Charles R. Holliday, USAF
Fleet Weather Central/Joint Typhoon Warning Center
Guam, Marianas Islands

There was a sharp decrease in tropical cyclone activity from 1974. There were only 20 named tropical cyclones in 1975, a 30% decrease from the long-term average of 28.6 . Since 1945, only 1973 exceeds 1975 for total number of consecutive days without a named tropical cyclone. The record in 1973 was 183 consecutive days, while in 1975, 180 days elapsed between typhoon Lola in January and tropical storm Mamie in July. Of the 20 named tropical storms occurring between July 27 and November 24, 13 became typhoons. Three of these, Nina, Elsie, and June, became supertyphoons with maximum winds exceeding 130 kn. The most noteworthy event of the 1975 season was the occurrence of supertyphoon June, the most intense tropical cyclone ever recorded.

At 0843 on November 19, reconnaissance aircraft measured a record low 700-mb height of 1984 m while traversing the eye and obtained a coincident minimum sea-level pressure (MSLP) of 876 mb (25.87 in) by dropsonde near the cloud wall. This observation was the lowest on record, slightly lower (1 mb) than typhoons Ida in 1958 and Nora in 1973. June's central pressure well surpasses the lowest Western Hemisphere reading (892.3 mb), and that obtained by aircraft in hurricane Camille (905 mb).

Casualty reports indicate that typhoons Phyllis and Rita has accounted for the majority of tropical cyclone related casualties in Japan. Phyllis caused 60 deaths and 146 injuries in mid-August. Later in the month, Rita reportedly caused the worst flooding on Hokkaido in 10 yr. On Taiwan, typhoon Nina caused 25 deaths and 168 injuries, also sinking a small freighter. Typhoon Betty, in September, caused an additional 12 deaths and injured scores. The Republic of the Philippines suffered casualties from typhoon Lola in January and two tropical depressions in December. Most deaths were caused by extensive flooding of low-lying areas. Lola accounted for the loss of 30 lives and serious damage to sugar-producing areas on the southern islands. The tropical depressions, although limited in destructive winds, caused torrential rains, and 97 lives were lost in the resulting floods. The greatest at-sea disaster occurred in the South China Sea when typhoon Flossie sank two timber freighters with the loss of 44 lives in late October.

Tables 1 and 2 show the distribution of typhoons and tropical cyclones by month and year from 1959 on with an average from 1945 through 1958. The comparison of averages between the two periods represents the influence of satellite data and increased ship reports.

The statistics for 1975 storms are contained in Table 3. The cyclone tracks are based on poststorm analysis. The dates given include the period when the storm was first identifiable, no matter what stage, until it dissipated or became extratropical. The maximum winds are over-water estimates of sustained windspeeds for a 1-min averaging period.

The individual typhoons during 1975 are described in the following narratives. Specific times and figures are GMT. Tropical storm summaries can be found in the appropriate "smooth log" of the Mariners Weather Log.

LOLA

In mid-January, the monsoom trough, normally located south of $5^{\circ}N$ during this time of year, moved northward. A circulation was first detected in the trough on January 18 approximately 400 mi south of Guam. Over the next five days this tropical disturbance was to develop into typhoon Lola. Lola was distinguished by being only the ninth typhoon in the month of January since 1945.

From its origin, the circulation tracked west northwestward as it intensified to tropical storm strength on January 22. At that time Lola was 75 mi east of the Palau Islands with northwesterly winds of 35 kn observed on Koror. Wind, rain, and high seas from Lola lashed the Palau Islands for the next 24 hr as the storm moved through. Major damage to agriculture occurred on the northernmost island of Kayangel, with banana, papaya, coconut, and taro crops almost totally destroyed.

From the Palau Islands, Lola moved westward under the steering influence of strong 500-mb ridging to the north. With upper-level outflow restricted in the eastern semicircle by strong ridging to the east,Lola developed to minimal typhoon strength late on the 23d. Aircraft reconnaissance reports on the 24th indicated the typhoon's central pressure had reached its minimum of 976 mb.

Typhoon Lola struck the central Philippines' sugar-producing provinces near peak intensity on the afternoon of the 24th. At least 30 persons were reported killed by landslides and flying debris, with more than 300 houses in the coastal town of Tandog destroyed by the storm surge.

Lola decreased to tropical storm strength while crossing the Philippines and entered the South China Sea. The storm then pursued a west-northwest track as the 500-mb ridge receded eastward. Lola regenerated to a peak intensity of 50 kn on the morning of the 26th. By the following morning, a cold frontal surge from Asia pushed into the South China Sea, weakening the circulation significantly. The remains of Lola moved southward in response to the building high pressure to the north. On the 28th satellite data indicated that the upper-level anticyclone had sheared off, and the remains of the surface circulation had drifted southward.

NINA

As tropical storm Mamie dissipated and drifted toward

Korea, the monsoon trough migrated northward leaving a well-defined trough line extending southeastward from the remains of Mamie into the Philippine Sea. A tropical disturbance spawned in this trough on July 29 and rapidly developed into typhoon Nina, one of the most destructive storms of the season. After initial detection by satellite, the tropical disturbance moved southwestward for approximately 36 hr as surface and upper-air circulations became organized and vertically aligned. By 1200 on the 31st the system slowed, intensified rapidly to tropical storm strength, and began turning to the northwest.

Nina underwent explosive deepening late on August 1. Aircraft reconnaissance data indicated a 63-mb drop in sea-level pressure at the typhoon's center between the 1st at 1437 and the 2d at 0830, with maximum surface winds increasing from 65 kn to 130 kn during that period. A peak intensity of 135 kn was attained on the 2d at 1200, approximately 200 mi east of Taiwan. The typhoon slowly decreased in intensity while approaching the island, making landfall near the coastal city of Hualien on the 3d at 0300 with maximum surface winds of 100 kn.

Much of the typhoon's strength was lost as it battered across Taiwan's central mountain range, fortunately sparing the most populous areas from the more intense winds near the eye. Nevertheless, Nina's trek across Taiwan reportedly left 25 people dead, 4 missing, and 168 injured. It was also reported that over 3,000 homes were at least partially collapsed, 39 fishing boats were sunk, and a 16,000-ton Korean freighter, the SUN STAR, was capsized near Koahsiung harbor. Damage from flooding and landslides was widespread. Nina entered the Formosa Straits with minimal typhoon strength, and weakened to approximately 60 kn before striking the China mainland on the 3d at 1500. Nina moved inland and lost tropical cyclone characteristics on the 4th.

ORA

The third typhoon of the season, Ora, was small and short lived. Ora first appeared as a weak circulation on the evening of the 8th. During the next 30 hrs, this weak circulation moved northwestward at 6 kn showing little intensification. On the morning of the 10th, a rapidly moving upper-level trough in the mid-latitude westerlies was located to the northwest of the circulation. This trough provided a highly efficient high altitude outflow channel which allowed Ora to grow from a tropical depression into a typhoon within 30 hrs. As this trough moved quickly toward the east, Ora responded with a north-northeastward movement. When Ora's eye passed over Miyako Jima at 0600 on the 11th, the weather station recorded 5-kn surface winds and a minimum pressure of 976 mb. Simultaneously, a ship (JL 11) 120 mi to the east reported 55-kn sustained winds. At 0749 on the 11th, 50-kn gusts were recorded at Kadena, Okinawa, 150 mi northeast of Ora. As the trough passed to the east, the subtropical high over central China build rapidly eastward and Ora shifted northwestward and accelerated to 15 kn. By the morning of the 12th, Ora had turned westward at 13 kn until landfall was made on the 12th near Yung-chia on the central China coast. Although little destruction was directly attributed to Ora, monsoon rains were spawned over the Philippines and caused widespread flooding and landslides. Choppy waters near Tocloban, Leyte, capsized a crowded motorboat leaving 15 dead and 30 missing.

PHYLLIS

From early August, the monsoonal trough had extended from the remains of typhoon Nina in central China to an area west of Guam. A number of surface circulations appeared in this trough, but it was not until the morning of the 11th that Phyllis first appeared as a tropical disturbance some 380 mi west-southwest of Guam. By 0600 on the 12th, the disturbance had become a 35-kn tropical storm. Aircraft reported multiple surface centers and a weak and diffuse 700-mb center. On the 13th at 0833, aircraft reported a closed wall cloud with an eye 30 mi in diameter. The Russian research vessel PRIVIV reported surface winds of 60 kn, 60 mi west-southwest of Phyllis at 1200. Phyllis was upgraded to a typhoon with maximum winds of 70 kn.

By the 13th the mid-tropospheric ridge over China began to weaken while the ridge east of Japan intensified. Twenty-four hours later, Phyllis' forward speed had increased to 18 kn. The typhoon attained a maximum intensity of 120 kn on the 14th after aircraft had recorded a minimum sea-level pressure of 920 mb. By the 15th Phyllis' movement had slowed to 7 kn and had become northwestward as the mid-tropospheric ridge built westward across Japan. After turning to the northwest, Phyllis once again accelerated and by the afternoon of the 16th, was located 165 mi southeast of Shikoku. As Phyllis approached Japan, Shimizu (elevation 99 ft) recorded sustained surface winds of 77 kn on the 16th at 1800 and a minimum pressure of 970 mb at 2300. Murotomisaki (elevation 606 ft) recorded sustained surface winds of 73 kn at 2000 on the 16th. Phyllis, with 80-kn sustained winds, made landfall during the morning of the 17th near the southwestern edge of Shikoku.

In her wake Phyllis left extensive damage and loss of life. On Shikoku alone there were at least 60 dead, 146 injured, and 12 missing due to the combination of heavy rains, flooding, and numerous landslides. At least 489 houses were reported collapsed, 577 damaged, 58 washed away, and thousands inundated.

RITA

The third typhoon in August, Rita, made landfall over Japan in the wake of typhoon Phyllis. The heavy rains brought by Rita made the storm the most damaging to affect northern Japan since 1965.

The typhoon's birth can be traced to the development of a monsoon depression some 180 mi southeast of Okinawa on the 18th. Drifting first east then westward, Rita began to gain strength as aircraft reconnaissance reports verified storm-force winds in the circulation on the following day. A minimum pressure of 983.4 mb was registered at Kadena Air Base on the 20th, although winds were comparatively light with a peak gust of 37 kn from the northwest recorded at 0514. An approaching short wave over Manchuria began to draw Rita on a more northward course late on the 20th. By the afternoon of the 21st, typhoon-force winds were reached and Rita's circulation had grown significantly in size. Gale-force winds extended some 300 mi in the typhoon's eastern semicircle. As the short wave continued to approach the typhoon, Rita accelerated gradually in a north-northeasterly direction, making landfall 30 mi west of Osaka late on the 22d. Prior to landfall, Rita's 40-60 mi diameter eye passed over Murotomisaki (elevation 606 ft), Shikoku. The station experienced a pressure reading of 966.3 mb and sustained surface winds of 80 kn.

Quickly crossing central Honshu, Rita veered slightly and accelerated to speeds of 30-35 kn ahead of an advancing cold front in the Sea of Japan. First tracking along the western coast, Rita crossed the northern portion of Honshu, finally emerging back into the Pacific on a northeasterly heading. Strong gusty winds occurred along the exposed southern coast of Honshu between the Kii and Boso peninsulas. Southerly winds gusting near 55 kn were recorded at Yokota Air Base between 0300 and 0400 on the 23d.

Merging with the frontal zone south of Hokkaido, Rita continued to track northeastward as an extratropical low. Torrential rains swept Hokkaido with amounts totaling near 8.2 in. in 24 hr. Landslides and flash flooding as a result of the rains were responsible for extensive crop and property damage with farmlands inundated and 36,000 houses flooded throughout Japan. At least 26 deaths were attributed to the typhoon. Newspaper reports indicate that it was the worst flooding in 10 yr for Hokkaido. Several major rivers on the island overflowed their banks leaving towns marooned and isolated.

TESS

While her beginnings can be traced back to August, the first warning on Tess was issued on the morning of September 2 after reconnaissance aircraft and satellite data indicated rapid development. Tess was upgraded to a typhoon on the 3d at 1200 when reconnaissance aircraft reported surface winds of 75 kn approximately 250 mi west of the Maug Islands. The typhoon was now moving in a more northerly direction toward a weakness in the collapsing mid-tropospheric ridge to the north. Thirty hours later on the 4th at 1800, Tess reached a minimum central pressure of 945 mb and maximum sustained surface winds of 95 kn. On the 7th at 0000, the OREGON reported estimated surface winds of 65 kn while 60 mi east-southeast of the storm's center. Tess maintained typhoon intensity until the 8th at 1800 when it moved into a hostile environment of colder water and began interacting with an approaching frontal system. Satellite data indicated that the typhoon was becoming extratropical, and by the morning of the 10th Tess had merged into the frontal system.

WINNIE

Winnie was first detected by satellite on September 5 as a weak tropical disturbance approximately 300 mi northwest of Wake Island. At this time typhoon Tess was approximately 900 mi to the northwest of Winnie with a surface trough extending southeastward to Wake Island. The combination of surface troughing and a favorable upper-air pattern allowed this disturbance to develop.

From her initial detection as a disturbance, Winnie moved slowly north-northeastward, attaining minimal tropical storm intensity at 2100 on the 8th. The storm was now 400 mi north-northwest of Wake Island and posed no significant threat to any inhabited islands. However, as reported by the Pacific Stars and Stripes, Winnie did represent a threat to shipping and, in fact, sank a 44-ft sailboat, THE FLATBUSH MAN, on a pleasure cruise from Marcus Island to Hawaii. The four people aboard were adrift for 13 days in a rubber raft until September 21 when a Russian whaling vessel picked them up.

From the time of initial tropical storm strength until 1200 on the 11th, Winnie was steered on a northerly course by the combination of a sharp mid-tropospheric trough to the west and a blocking ridge to the east. A 200-mb trough extending to the west of Winnie inhibited development past minimal typhoon strength with typhoon-force winds persisting only for a 24-hr period from 1800 on the 9th to 1800 on the 10th. The KYOYO MARU, located approximately 35 mi north of Winnie, reported sustained winds of 65 kn at 1800 on the 9th. Approaching a frontal system near 35°N, Winnie came under stronger steering flow, accelerated to near 20 kn, and began to weaken. A short wave trough moving through the long wave ridge diminished its amplitude, and Winnie assumed a more northeasterly track while continuing to accelerate. By 0000 on the 12th, Winnie was absorbed into the frontal system and became an extratropical system with maximum winds of 30 kn.

ALICE

On the morning of September 12, a tropical disturbance was identified on satellite data near 12°N, 148°E. This system became tropical storm Alice on the afternoon of the 16th and intensified to typhoon strength within 24 hr. On the 17th at 1430, aircraft reconnaissance data indicated a 32-mb drop in central pressure during the previous 21 hr, and maximum flight-level winds of 105 kn were recorded on this eye penetration. Reduced inflow resulting from the development of typhoon Betty (1200 mi to the east) inhibited further development as Alice approached central Luzon. At 2000 on the 17th the typhoon made landfall near Casiguran, Luzon, with maximum surface winds of 75 kn. Alice entered the South China Sea at 0400 on the 18th with surface winds of 65 kn. Wallace Air Station reported winds of 40 kn with gusts to 60 kn at 0129. A peak gust of 42 kn was recorded at Baguio at 0432. No significant damage was reported during the Luzon crossing.

Alice continued on a west-northwest track across the South China Sea in response to moderate steering flow along the southern periphery of the 500-mb subtropical ridge. Maximum surface winds decreased to 60 kn at 1200 on the 18th, and Alice maintained that intensity until just prior to striking the Hainan coast at 1800 on the 19th. Alice was still well organized as she entered the Gulf of Tonkin with 50-kn winds, but she weakened rapidly thereafter and dissipated upon moving inland over North Vietnam.

BETTY

As typhoon Alice approached the Philippine Islands on September 16, another tropical circulation was detected in the monsoonal trough some 200 mi south of Guam. This disturbance passed within 50 mi of Guam early on the 17th. It became a tropical storm on the morning of the 18th while moving westward at 12 kn.

On the 19th, as a weak upper tropospheric trough to the west deepened and created a highly efficient outflow channel in the mid-latitude westerlies, Betty began to intensify. At 0230 on the 22d, typhoon Betty attained a maximum intensity of 95 kn as reconnaissance aircraft recorded a minimum sea-level pressure of 944 mb.

At 1200 on the 21st, a ship located 140 mi northeast of the storm estimated winds at 55 kn and seas of 27 ft. The September 22 0000 rawinsonde at Ishigakishima (110 mi north-northeast of Betty) showed 70-kn winds from the 3,000-ft through the 18,000-ft level. Upon reaching Taiwan, Betty began to weaken. Her track became west-northwestward as she interacted with a lee-side trough created by the high mountain ranges on Taiwan. Packing winds near 80 kn, Betty crossed into southern Taiwan about 15 mi north of Taitung. Unofficial reports indicated 12 dead, scores injured, and hundreds homeless in the typhoon's wake. Nearly a thousand tourists were stranded as mudslides covered highways. In addition, more than 200 homes were leveled and hundreds of others damaged.

After crossing the mountains of southern Taiwan, the storm's track became west-southwesterly. Weakened by the rugged terrain, Betty entered the Taiwan Strait as a minimal typhoon. It continued to weaken and crossed the Chinese coast on the evening of the 23d with 50-kn winds. By the 24th, Betty had degenerated into a low-pressure area some 100 mi north of Hong Kong.

CORA

Weak troughing in the low-level easterlies spawned a disturbance near 10°N, 142°E, on the morning of September 29. This disturbance drifted west-northwestward for the next several days; on October 1, aircraft reconnaissance reported surface winds of 30 kn. Cora was upgraded to typhoon strength on the 3d when aircraft reconnaissance reported 70-kn surface winds and a closed wall cloud. The system lacked good vertical structure through the evening of the 3d when the 700-mb center was still displaced east of the surface center.

As Cora passed 100 mi to the east of Okinawa on the morning of the 4th, Kadena Air Base recorded a peak gust of 31 kn. That evening Cora attained a minimum central pressure of 943 mb and maximum sustained surface winds of 105 kn. Moving to the northeast at 30 kn, Cora passed 120 mi south-southeast of Toyko on the evening of the 5th. Satellite data on the 6th indicated that there was very little upper-level outflow, but an apparent low-level circulation was still visible. The remains of Cora were now moving to the east at 40 kn as an extratropical system with surface winds of 55 kn.

ELSIE

By October 6, the monsoonal trough had become quite active and was oriented east-west along 8°N from the Philippines to 160°E. Typhoon Elsie developed in this trough with a well-defined surface circulation located approximately 250 mi southwest of Guam on the 8th. Elsie attained typhoon strength on the 10th. At this point, she began slowing down as the storm approached the western extent of the midtropospheric subtropical ridge. Elsie then underwent explosive deepening, and aircraft reconnaissance recorded a 69-mb drop in the central pressure at the typhoon's center between the 102052 and 111430 fixes. The maximum surface winds increased from 65 kn to 135 kn during this period.

As Elsie approached the Bashi Channel, Basco, in the Bataan Islands, reported maximum sustained winds of 65 kn, 40 mi east of Elsie's center. Elsie continued moving west-northwestward through the Bataan Islands on the 12th. As the typhoon entered the South China Sea, it began to weaken with inflow restricted to the north by the Asian continent. Still, the Royal Observatory in Hong Kong reported that typhoon Elsie was one of the most intense typhoons ever to affect Hong Kong in the month of October. Royal Observatory radar began tracking the storm by late afternoon on the 13th and Elsie passed 35 mi to the south of Hong Kong on the 14th. At that time the maximum sustained winds recorded at Hong Kong were 70 kn with gusts up to 118 kn. Fortunately, the maximum winds occurred at low tide, thus reducing flooding. Seven ocean-going vessels drifted from their moorings, and one small craft and a fishing junk capsized. The lowest pressure recorded in Hong Kong was 987.5 mb. There were no fatalities reported, but 46 people were injured by flying debris.

After passing south of Hong Kong, Elsie continued westward, making landfall on the southern China coast at approximately 1500 on the 14th. Elsie then dissipated rapidly over the Asian mainland.

FLOSSIE

The circulation which was to become typhoon Flossie was first analyzed 500 mi west-southwest of Guam on the 0000 surface analysis of October 14. Its development was somewhat retarded on the 15th and 16th by the presence of a depression 420 mi to the north-northeast. On the 19th the disturbance moved into the South China Sea after crossing Luzon and began to intensify. The first warning was issued on the morning of the 20th based on satellite and synoptic data. Early the next morning reconnaissance aircraft reported a central pressure of 989 mb, and the depression was upgraded to tropical storm Flossie.

A container ship, the MAYAQUEZ, reported a pressure of 980 mb and 60-kn winds on the afternoon of the 21st. At that time the MAYAQUEZ was 40 mi south-southwest of the storm's center. Flossie was upgraded to a typhoon on the afternoon of the 22d when located about 250 mi south of Hong Kong. Two timber freighters, the MING SING and KINABALU SATU, sank between Flossie and the southern approaches to Hong Kong on the 21st and 22d, respectively. Due to the high seas and typhoon-force winds, all rescue efforts failed and a total of 44 men were lost. Three survivors were picked up in a lifeboat a week later.

Flossie reached a maximum intensity of 70 kn on the evening of the 22d. As the typhoon approached landfall on the 23d, its circulation was disrupted in the northeast quadrant by the terrain and its intensity began to diminish rapidly. Flossie made landfall on the afternoon of the 23d on the northeast portion of the Luichow Peninsula. Winds at that time were down to 50 kn.

Although typhoon Flossie's maximum winds were only 70 kn, the seas generated in the northern South China Sea remained a threat to shipping for several days.

IDA

Destined to spend its entire life cycle at sea, Ida was first observed as a tropical disturbance on November 5, 150 mi northwest of Ponape. The disturbance initially tracked westward at 8 kn with dual circulation centers oriented along a northeast to southwest axis. The disturbance became a tropical depression at 0600 on the 6th and then began moving toward the north. Early on the morning of the 8th, the depression was upgraded to tropical storm Ida and accelerated toward the northwest at 10 kn. Ida continued to intensify as the center passed near the southern Mariana Islands, with wind gusts of 32 kn reported on Guam on the 7th. On the 9th Pagan Island in the northern Marianas reported 40-kn winds.

The storm attained typhoon intensity by 1800 on the 9th and began tracking toward the north-northeast at an accelerated rate. A minimum central pressure of 959 mb was observed by aircraft reconnaissance at 1437 on the 10th. By 0000 on the 11th, Ida was moving toward the north-northeast at 33 kn and had lost most of her tropical cyclone characteristics. Twelve hours later, Ida had combined with a frontal system and continued to move rapidly northeastward as an extratropical system.

JUNE

June had been under frequent surveillance by satellite and aircraft since her birth in the central Carolines on November 16. Initially, she moved slowly westward, becoming quasi-stationary about 445 mi south of Guam. On the 18th June began to move northward. Simultaneously, she began to deepen rapidly, her surface pressure plummeting 52 mb in 11 hr and 90 mb in 24 hr. By the 19th, the winds of June had increased to an estimated 160 kn as the typhoon reached its lowest pressure some 230 mi west-southwest of Guam. As June tracked north-northwestward her circulation reached exceptionally large proportions. Sustained surface winds of 50 kn or greater extended 200 mi outward from the center.

On the evening of the 19th, June passed approximately 200 mi to the west of Guam. More than 3,200 island residents fled into evacuation centers. There was severe flooding in low-lying areas, with several buildings and homes damaged or destroyed by gale-force winds and storm surge. A peak gust of 70 kn was recorded at Anderson Air Force Base. Island losses amounted to an estimated $300,000 with most of the damage to crops. Eauripik Atoll in Yap district suffered severe property and crop damage. Newspaper reports stated that "sizable portions" of the island were washed away by the heavy seas, but that no deaths or injuries occurred. Flooding and crop damage were also reported on Woleai Atoll and on other low-lying islands in Yap district; however, no casualties were reported on any of the islands.

After passing abeam of Guam, supertyphoon June turned northwestward, but by the 22d she began recurving toward the northeast as maximum winds fell to 100 kn. On the 23d the storm began accelerating rapidly in the strong westerlies and its forward speed reached nearly 60 kn. With an influx of cold air, June became extratropical above 30°N, still possessing winds of typhoon intensity.

FLOOD STAGE

YEAR 1974

The following sections, which would normally appear in this issue of the Climatological data, have been delayed. They will appear as delayed data in a subsequent issue which normally carries late reports:

General Summary of Flood Losses - 1974

Estimated Flood Losses - 1974

Loss of Life and Property in the United States from Floods - 1974

Distribution of Estimated Flood Losses - Charts - 1974

Losses in Individual Severe Floods - 1974

Flood Damage Estimates by States - 1974

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

YEAR 1975

R. J. Haley, Office of Hydrology

Several parts of the country were hit by severe flooding during 1975. Some of the most significant floods included the spring overflow in the Mississippi River Basin; the March floods in Kentucky; the April floods in lower Michigan and in Alabama and northwest Florida; the flooding in the Sun River Basin in Montana in June; the Red River of the North flood and the New Jersey floods during July; the Hurricane "Eloise" floods in September; and the flooding in western Washington during December.

Monetary losses from these and other floods during 1975 exceeded $1 billion. There were at least 113 flood-related fatalities.

Following is a brief summary by months of the most significant flooding during the year. A more detailed summary can be found in the monthly issues of this publication.

JANUARY

The most damaging overflow during January occurred in the Snohomish Basin in Washington. The Snoqualmie River, a major tributary of the Snohomish, reached 5 feet over flood stage at Carnation, the highest stage there since 1959. The flood was caused by warm rains augmented by snowmelt as freezing levels climbed from 4,500 feet to 9,000 feet. Total damages were estimated to be near $4 million.

A record flood crest occurred at Pendleton, OR, on the Umatilla River. This flood was also caused by warm rains and snowmelt. Levees protect the city of Pendleton and damage was, therefore, relatively light, less than a quarter million dollars.

Minor to moderate flooding was widespread through the Gulf of Mexico and Atlantic Slope drainages from Texas to Virginia, and in the Ohio Basin. Some overflow occurred also in the lower Missouri, White, Arkansas and lower Mississippi Basins. Damage was confined for the most part to agriculture. A youth playing in a rain-swollen stream in the Buffalo, NY, area was drowned.

FEBRUARY

There were two noteworthy flood events during February. The first occurred at Nacogdoches, TX, during the night of January 31-February 1 when as much as 13.5 inches of rain fell, causing overflow of two small creeks that run through the city. Severe damage estimated at almost $6 million resulted from this flash flooding. This includes $3 million damage to 500 residences that were flooded. In addition, there were 4 lives lost. The second major event of the month took place in the East Gulf of Mexico drainage. Widespread flooding occurred along small streams in the Alabama and Choctawhatchee and other basins in Alabama. Record to near record discharges were reported on some of these. Overflow of Catoma Creek which runs through the southern edge of Montgomery, AL, forced the evacuation of 200 persons from their homes. A 400-foot long section of the Walter Bouldin Dam within the Coosa River power system gave way, and the resulting damage to the structure was estimated at $17 million. Crest stages along the main stem of the lower Alabama river ranged to almost 12 feet over flood stage. In the Choctawhatchee Basin the Pea River reached the highest stage since 1929 at Elba, AL, where the crest was more than 13 feet over flood stage and forced 700 persons from their homes. Preliminary estimates of the total damage in the Alabama River Basin were near $35 million, and one life was lost. Losses in the Choctawhatchee, Escambia, and Tombigbee basins totalled about $2.5 million. Also, one life was lost.

Significant flooding occurred also in the Ohio River Basin, particularly in Ohio, Indiana, and Kentucky. Damages totalled several million dollars in these states. Two children were drowned when a car stalled at a small stream crossing near Columbus, IN. Less severe flooding occurred in numerous other areas from the Mississippi Valley to the east coast as well as in several areas in the southern plains, and in a few places in the Pacific slope drainage of California and Oregon. During the fore part of the month lowland flooding occurred along the main stem of the lower Ohio River. The heavy inflow from the Ohio resulted in lowland flooding along the main stem of the lower Mississippi down to Caruthersville, MO. Flooding was renewed along the Ohio River later in the month and in some reaches this overflow extended through March and into April.

MARCH

Flooding was widespread during March. A number of areas experienced severe overflow which in some cases was of record proportions. The State of Kentucky was hit by widespread flooding and flash flooding at midmonth. Eleven counties in the western, south-central and southeastern part of the state were declared disaster areas. The highest stage since the beginning of records in 1908 occurred on the Cumberland River at Williamsburg, KY, when the river rose to 13.5 feet over flood stage. Record flooding also occurred on several smaller streams in the state. Major overflow occurred on the Green and Barren Rivers with minor to moderate flooding in the Kentucky basin as well as some other areas. State-wide the flooding cost 3 lives and an estimated property damage of $20 million. Besides the flooding in the Tennessee River Basin in western Kentucky, major flooding occurred in other parts of the basin, including the main stem. The highest stage since 1948 occurred at Columbia, TN, when the Duck River reached more than 16 feet over flood stage. Major agricultural flooding occurred in the Wabash Basin of Indiana and Illinois, where

556,000 acres were inundated and total damages were put at more than $8 million. Other significant flooding in the Ohio Basin in March included nearly one-half million dollars damage on the Tug Fork in the Big Sandy drainage in West Virginia, and almost a quarter million dollars damage along the lower Scioto River in Ohio.

The State of Mississippi suffered major flooding during the month. The lower Yazoo Basin was hardest hit, and a very significant factor was the backwater flooding from the Mississippi River. More than 570, 000 acres of farmland were inundated. Sharkey and Issaquena Counties were 90% under water. Between seven and eight hundred families had to be evacuated from their homes. About 1,300 persons were evacuated from their homes in the Tombigbee River basin in Mississippi. Major flooding occurred in other parts of the East Gulf Drainage to Georgia and northwest Florida. Preliminary damage estimates for the flooding in Mississippi, Alabama, Georgia, and Florida totalled more than $24 million. Nearly $18 million of this was in the Yazoo Basin. Two lives were lost at Byram, MS.

Unseasonably warm temperatures caused rapid melting of a 10 to 20-inch snow cover over tributary basins of the Mississippi River in southern Wisconsin, northeast Iowa, and northwest Illinois. This melt was augmented by more than an inch of rain. The runoff which resulted produced a record high stage on the Pecatonica River at Martintown, WI. The heavy inflow from the Pecatonica helped cause the record high stages on the Rock River at Rockton and Rockford, IL. Widespread evacuations of residents of many unincorporated areas between Loves Park and Shirland, IL, occurred with 380 homes affected. There were 200 families evacuated at Freeport, IL, and more than 2,000 persons were forced from their homes in the Rockford, IL, area. Damage estimates ran as high as $10 million for the Rockford area.

Flooding along tributaries of the Mississippi River in western Tennessee reached serious proportions in some areas. In this region where flooding is relatively infrequent, crest stages reached more than 10 feet over flood stage on the Obion River and on the North and South Forks of the Forked Deer River. At South Fulton in the Hatchie River basin 1,000 persons were evacuated, and flood losses were put at $2 million. Damages in other areas totalled about $1 million.

Flood waters in the White River basin in Arkansas covered about 292,000 acres and caused $2.5 million damage, about one-half of which was to agriculture. More than $1 million flood losses occurred in Virginia along the lower James River and on the Appomattox River.

Flooding which began along the lower Ohio River late in February had ended at most stations before the middle of March, but later storms caused renewed overflow with the major crests occurring in April.

By the end of the third week of March flooding had developed along the main stem of the Mississippi River at all but a few places from Keithsburg, IL, to Donaldsonville, LA, and continued into April at most stations. The greatest overflow occurred at and below the mouth of the Ohio River where major crests occurred in April.

A mid-month storm brought flooding to streams in the northern California coast drainage with the most significant occurring in the Eel Basin. Damages were near $2 million.

APRIL

Lower Michigan was hit by severe and widespread flooding during April. Record high stages were observed in the Grand River basin on the Thornapple River at Hastings and Caledonia, and on the Red Cedar River at Williamston and East Lansing. Crest stages on the Red Cedar were 5 to 7 feet above flood stage. Flood losses in the Lake Michigan drainage were over $34 million, but more than $29 million of this occurred in East Lansing and elsewhere in Ingham County. About 800 families were evacuated from their homes in East Lansing and 100 business places were flooded. In the Lake Huron and Lake St. Clair drainages flood losses exceeded $14 million, of which more than one-half occurred in the Flint River basin. The flooding on the Flint and the Shiawassee Rivers was the worst since the record flood of 1947. Four lives were lost throughout the state, 3 in the Grand Basin and one in the Shiawassee Basin. In all of lower Michigan there were at least 17 counties affected by the flooding, and total damages were put at $48,469,000.

The worst flooding since the record overflows in 1929 occurred in parts of southern Alabama and northwest Florida with most crests occurring near the end of the second week of April. A 21-hour storm rainfall total near Enterprise, AL, was in excess of 17 inches. An elongated 1,600 square-mile area across southern Alabama from near Evergreen to Newton received about 14 inches during the storm. Overflow ranged to a depth of 12 feet above flood stage on the Apalachicola, Choctawhatchee, Yellow, and Murder Creek. There was severe and widespread flash flooding along smaller tributaries. Damage was extensive to all types of property. An eleven-county area in Alabama suffered more than $16 million damage, and in northwest Florida more than $8 million damage occurred over a seven-county area. In each state agricultural losses accounted for more than half the total damage since the flooding struck during a very vulnerable period when crops were being planted, or soil was being prepared for planting. Communities which suffered the worst damage were those along the Choctawhatchee, lower Pea, Yellow, Murder Creek, and the Chipola Rivers. Many thousands of persons were forced from their homes by the flood waters. A motorist was drowned in the Brewton, AL, area when his car was swept into Murder Creek.

Flooding which began in March along the lower main stem Mississippi River reached its crest in April with peak stages ranging upward to 10 feet above flood stage. The flood gates at Bonnet Carre spillway were opened from April 14 to 27. This diversion plus those upstream into the Atchafalaya River took about 2 feet off the crest at New Orleans. The overflow of the Mississippi and flooding in backwater areas along other streams in the lower Mississippi Basin inundated several hundred thousand acres and caused approximately $100 million damage. The March flood on the Yazoo and Big Black Rivers in Mississippi continued into April, and additional rainfall prolonged the overflow.

Spring snowmelt runoff augmented by heavy rains brought significant flooding to the Souris Basin in North Dakota and to the Red River of the North Basin in North Dakota and Minnesota. Main stem crests on the Souris and on the Red River at and below Drayton, ND, did not occur until May. Snowmelt and rainfall produced overflow along the upper Mississippi River also with losses estimated at less than $3 million. Generally light to moderate overflow occurred along several tributaries of the upper Mississippi and also on several in the Missouri Basin. This overflow in the upper Mississippi Basin continued into May in many areas. The town of Beulah, ND, suffered several thousand dollars damage, and 200 persons were evacuated from their homes. Also, there was one drowning when a car slid off a flooded county road.

MAY

Record high stages were recorded at several stations (including Logan, Sawyer, and Velva) along the Souris River in North Dakota as the river reached peak levels during the flood which began in April. Early May rainfall added to the runoff, which was primarily the cause of the record overflow. Hundreds of thousands of acres of farmland were inundated (167,000 acres in Bottineau County alone), and a number of farm families had to be evacuated. And more than 3,100 persons were evacuated from flood prone areas in Minor, ND, as a precautionary measure. There were two deaths by drowning. Flooding continued into June along the Souris below Lake Darling. The mostly rural flooding along the Red River of the North which also began in April had largely run its course by the middle of the month.

Severe flash flooding struck northwest Charlotte, NC, early on May 30, and urban and small stream flooding was widespread in Gaston, Mecklenberg, Cabarrus, and Stanley Counties. Damage in northwest Charlotte was estimated to be near $3 million.

Th Mississippi River was above flood level at all reporting stations, except Minneapolis, MN, from headwaters to Dubuque, IA, as the month began. By the 10th of May, the river had crested above flood stage at all stations downstream to Caruthersville, MO (except at St. Louis, MO). Crest stages ranged upward to 5 feet over flood level. Overflow was rather serious in some areas. The crest stages at Davenport and Dubuque, IA, were the third highest in this century. Damages at Davenport alone were put at $800,000.

Severe flash flooding occurred in several areas in the Ohio River basin in Kentucky, and the Virginias. Losses were estimated at $4 million in the headwater areas of the Levisa Fork in the Big Sandy Basin in Kentucky, and two lives were lost. At Pound, VA, more than 100 homes and businesses were flooded, 250 persons evacuated, and $300,000 damages occurred.

At Stillwater, OK, 4 inches of rain in 1-1/2 hours caused flash flooding that drove about 200 persons from their homes. Heavy agricultural flooding developed again in the lower Red River Basin in Arkansas and Louisiana. More than one million acres were inundated and losses were over $20 million. A child was drowned in urban flooding at Bastrop, LA.

Flooding occurred on several Alaska rivers. Major overflow developed on the lower Yukon River when an ice jam at Holy Cross formed a lake 80 miles long which covered an area of about 1,000 square miles. Several communities above Holy Cross were flooded and many persons were forced from their homes. A similar condition developed on the Kuskokwim River when an ice jam formed above Napakiak and backed water up into several communities upstream to Akiak.

JUNE

A record flood crest occurred on the Maple River at Enderlin, ND, during June. Other crests during the major flooding which began during the latter part of the month in the Red River of the North Basin did not occur until July.

Record overflow in the Skunk Basin in the vicinity of Ames, IA, resulted in over $5 million damage with 50,000 acres inundated. Extensive flooding occurred elsewhere in Iowa, on the lower Cedar, portions of the Iowa River, and in the Des Moines River Basin.

Flooding second only to the record flooding of 1964 occurred in the upper Missouri River basin in Montana when the Sun River crested 6 feet over flood stage at Great Falls, MT. Damages around Great Falls were estimated at $17 million with 20,000 acres under water. There were 4,000 persons evacuated from their homes. Flooding in other parts of the Missouri Basin in Montana caused losses totalling about $4 million. Nearly a million dollars in damages occurred in the Kansas River Basin in Kansas. The greater part of this occurred in the vicinity of Oberlin, KS, where Sappa Creek rose to about the same height reached in the record flood of 1956. In east-central Kansas flooding in the Marais des Cygnes Basin caused almost $500,000 in damage.

In Indiana crop losses of $2.5 million were reported in the Wabash Basin where 25,000 acres were inundated. Arkansas River tributaries in northern Oklahoma and southeast Kansas overflowed causing extensive crop damage and more than $1.5 million damage to roads and bridges. Approximately 200,000 acres were inundated in the Chikaskia, Ninnescah, and Cottonwood Basins, and 50,000 acres in other basins.

Record flooding along Pine Island Bayou in Texas followed in the wake of a storm on June 9-10 that deposited 17.5 inches of rain at Sour Lake. All the inhabitants along Pine Island Bayou were evacuated, including the 2,000 residents at Sour Lake. Twin infants were drowned in a flooded home in Port Arthur, TX. Total damages were put at more than $10 million. In addition, this same storm resulted in $1 million urban damage in the Houston area.

JULY

The major flooding which began in June in the Red River of the North Basin reached its climax in July. Record high stages were recorded at 11 stations. These were on the Maple and Sheyenne Rivers in North Dakota; and on the South Fork Two Rivers, South Branch Buffalo, Buffalo, and Wild Rice Rivers in Minnesota, and also on the main stem of the Red at Halstad, MN. It was one of the most damaging floods ever to strike this region. It was unique in that it resulted entirely from rainfall whereas most floods in the Red Basin are caused at least in part by snowmelt runoff. There were 2,369,370 acres under water. Total losses were estimated at more than $273 million, of which 95% was losses to agriculture. Four lives were lost.

Two separate storms produced severe flooding in the lower Delaware Basin and on New Jersey coastal streams. New Jersey suffered the worst losses with almost $56 million of a total of $85 million. The second highest stage of record was observed on the Millstone River at Blackwells Mills, NJ, where mass evacuations occurred. Between 1,200 and 1,500 families were evacuated in Trenton, NJ. Six lives were lost in New Jersey, and one life lost in Pennsylvania and in Delaware. There were three lives lost in flash flooding in Maryland with damages of more than $1 million reported. And in North Carolina, there were $5 million damages reported from flooding on the Nottoway and Meherrin Rivers, and three persons were drowned. In addition, $5 million damage occurred due to overflow over other eastern North Carolina streams.

Widespread flooding occurred for the second time in the year in southern Alabama and parts of northwest Florida. Damages were in the hundreds of thousands of dollars as some of the smaller rivers and creeks exceeded previously recorded heights. Major flash flooding occurred in Las Vegas, NV, and along the Virgin River. Damage was estimated at $6 million with $3.5 million of this in North Las Vegas. There were two lives lost. Flash flooding also hit several areas in Arizona, causing over $500,000 damage. And in the Columbia River Basin flooding on the Wallowa River in Oregon resulted in $2.5 million damage while $750,000 damage was reported in the Melheur River Basin, also in Oregon.

AUGUST

Record crest stages were observed on the White and Little Muskegon Rivers in Michigan during August (and extended into September) when record monthly rainfall amounts were recorded. Extensive agricultural damage occurred, and many communities experienced urban flooding. Monetary losses in these two basins were put at $5.4 million.

A record crest occurred on the Trempealeau River at Dodge, WI, following a 6-inch downpour on August 23. The major flooding which began in July in northwest Florida continued into August and the Shoal River reached a record high stage at Crestview, FL.

Flash flooding took seven lives during August and did extensive damage in several areas including Cleveland, OH, and Buffalo, NY. The flooding in the Cleveland area caused by a 5-inch rain in a 2-hour period resulted in an estimated $5 million damage, most of which occurred in the zoological park and a downstream industrial park. Two drownings occurred. The flash flooding in the Buffalo area was most severe in the town of Cheektowaga where damage was estimated at $3 million, with about $500,000 urban damage in Buffalo and in the town of Lancaster. This flooding was caused by 3.5 inches of rain falling in about 5 hours.

Two persons were drowned in a flash flood near Green Bay, VA, when their car was washed off a bridge over the Sandy River on State Route 629.

Four to seven inches of rain fell in a 10-hour period on the 27th in Dallas, Warren, and Polk counties in Iowa. The resultant flash flooding in the Des Moines metropolitan area and nearby areas caused about $1 million damage.

Heavy local rains caused flash flooding on the 1st on Sappa Creek in northwest Kansas. Two children were drowned when a car was washed off a bridge over Sappa Creek near Oberlin. And on the 10th, a small boy was drowned when a car was washed off a bridge across Bobtown Creek in western Nicholas County of Kentucky. The creek rose about 8 feet in ten minutes following an estimated 4.5 inches of rain in one-half hour.

SEPTEMBER

Rainfall associated with Hurricane "Eloise" during the third week of September caused severe and widespread flooding, which resulted in 50 fatalities and several hundred million dollars monetary losses. Particularly hard hit were Puerto Rico where 34 persons perished and losses totalled about $60 million, and the Susquehanna River basin of Pennsylvania and New York where 9 persons died and losses approaching $300 million were sustained. Serious losses also occurred in the Lake Ontario drainage, and in Connecticut, Maryland, and Virginia. Losses were substantially less in several other states.

In Puerto Rico the southwest region was most affected. Over 26 inches of rain fell over the southwest slopes near Sabana Grande during the period September 15-17. Major flooding occurred on 21 rivers on the island. It was most serious in the south and west portions on the Tallaboa, Guayanilla, Anasco, and Culebrinas Rivers (which crested at stages estimated by the U.S. Geological Survey to have a return period greater than 100 years) and also on the Patillas, Cerrillos, Bucana, Portuguese, Guanajibo, Rosario, and Loco Rivers; and on the Rio Grande de Arecito in the western interior. In addition to the

34 lives lost in Puerto Rico, more than 275 persons were injured and over 10,000 were left homeless.

Record September rainfall occurred over the Susquehanna Basin, due in large measure to the effects of Hurricane "Eloise." Almost continuous rain fell from the 22d to the 26th, with totals of 5 to 7 inches over most of the basin but with 10 to 15-inch totals over the lower and middle Susquehanna Valley. Serious flash flooding occurred along many of the smaller streams in the Basin. The main stem Susquehanna River crested at stages ranging 5 to 13 feet above flood level. The crest was 6.8 feet over flood stage at Harrisburg, PA, the sixth highest of record. In the New York portion of the basin the Chemung River crested 12 feet over flood stage at Chemung, the second highest of record at that point.

Damages were extensive in the Susquehanna Basin although only a small fraction of those which occurred during the floods caused by Hurricane "Agnes" rains in June 1972. In Pennsylvania, preliminary loss estimates were about $242 million, with 5 fatalities and 20,000 evacuees. In New York, losses were put at $54 million, with $32 million in Chemung County alone. There were 4 fatalities, and 3,500 evacuees.

Flooding and flash flooding in parts of the Potomac River basin in Maryland and Virginia, as well as along several smaller tributaries in the Chesapeake Bay drainage, caused damage totalling about $40 million. The Monocacy River crested 15.8 feet above flood stage at Frederick, MD, where two water system pumping stations and a sewage treatment plant were closed. Urban and flash flooding of small streams in Maryland caused an estimated $24 million in damage and 3,500 persons were evacuated from their homes. Ellicott City, MD, was hardest hit. Almost $12 million damage occurred to homes and businesses along Four Mile Run in Arlington County and in Alexandria, VA, where 1,500 persons were evacuated. Also, $3 million damage occurred in Washington, DC, mostly to the Metropolitan Transit Authority.

Nearly $1 million damage occurred along South Carolina streams where one death occurred. Flash flooding also took one life near Rupert, WV, in Red Rock Canyon in California, and in Las Vegas, NV.

OCTOBER

A mid-month storm caused the most significant flooding and flash flooding during October, particularly in Mississippi, Tennessee, and Kentucky, while minor to moderate overflow occurred thru the East Coast drainage as a result of the same storm.

The middle portion of Tennessee received an average of 4 inches of rain on the 17th-18th with as much as 6 inches locally. Up to 6-foot overflow occurred on the Duck and 4 to 5-foot overflow on the Elk River. Over 20,000 acres of corn and soybeans were flooded. Crop losses were put at $3 million and total losses in the state at $10 million. Considerable lowland flooding occurred in Kentucky, where 30,000 acres were affected along portions of the main stem Ohio, the Green, Barren, and Salt Rivers.

As much as 6 inches of rain fell over the headwaters of the Tombigbee River in Mississippi. The resultant flooding and flash flooding caused almost $1 million damage, mostly to agriculture. And flooding and flash flooding in the Pearl and Pascagoula Basin caused almost $1 million damage and the loss of one life. Considerable damage also occurred in the Big Black Basin in Mississippi where flash flooding from Bear Creek forced 200 families from their homes in Canton.

NOVEMBER

There was no serious flooding during November. Minor to moderate lowland overflow occurred in several widely scattered local areas in the country including the East Coast drainage, and in a few places in the central and plains states and north Pacific coastal drainages.

Severe urban flooding did occur in several areas including Birmingham, Mobile, and Baldwin County in Alabama; New Orleans, LA; and San Juan, PR.

DECEMBER

Heavy snow followed by excessive rainfall caused the most serious flooding in recent history early in December in river basins which drain the west slopes of the Cascade Mountains in Washington State. Stampede Pass, WA, received a total of 18.81 inches of rain in five days and five hours from the evening of November 29 thru December 4. Of this amount, 6.75 inches fell in the 24-hour period ending 11 p.m., December 1, a value estimated to have a return period greater than 50 years. Rivers reached record to near-record heights. The Snohomish River crested at Snohomish, WA, at a record high stage of 33.2 feet, 8.2 feet above flood stage, on December 4. The Snoqualmie, Stillaguamish and the Chehalis Rivers rose to levels only a little lower than the highest of record. Water overflowed dikes in the lower Snohomish Valley and some dikes failed. In Snohomish County alone there were 35,000 acres flooded with about 1,300 head of cattle drowned and 130 homes flooded. There were seven western Washington counties declared disaster areas by the State and Federal Governments. In all, there were 108,900 acres inundated, 4,800 persons displaced, and more than 1,500 residences flooded. Preliminary estimates place the flood losses for the coastal streams of Washington at $21 million.

Other parts of the Pacific Northwest also experienced serious flooding during early December. In the Columbia River Basin, damage totalling more than $4 million was reported in the Yakima watershed in Washington. And more than $1 million damage was reported in the Willamette River basin in Oregon. Also, flooding along north coastal streams in Oregon (the Wilson, Nehalem, Siuslaw, and other rivers) caused damages of about $850,000.

Minor to moderate flooding and only light damage occurred in scattered areas in other parts of the country from the plains to the east coast.

ANNUAL FLOOD LOSSES FOR UNITED STATES

Annual Flood Losses and Savings for years 1933 to 1947, inclusive, have been published in the Monthly Weather Review as follows:

Year	Issue	Pages
1933	Vol. 62, No. 1, Jan. 1934	25-27
1934	Vol. 62, No. 12, Dec. 1934	465-467
1935	Vol. 63, No. 12, Dec. 1935	362-365
1936	Vol. 65, No. 1, Jan. 1937	28-31
1937	Vol. 66, No. 12, Dec. 1938	426-430
1938	Vol. 68, No. 9, Sept. 1940	262-263
1939	Vol. 68, No. 11, Nov. 1940	329-330
1940	Vol. 69, No. 7, July 1941	217-218
1941	Vol. 71, No. 11, Nov. 1943	185-186
1942 & 1943	Vol. 73, No. 8, Aug. 1945	137-139
1944 & 1945	Vol. 76, No. 6, June 1948	113-116
1946	Vol. 76, No. 9, Sept. 1948	208-210
1947	Vol. 77, No. 9, Sept. 1949	262-265

Annual flood loss data for the year 1948 and for subsequent years are published in Climatological Data, National Summary as follows:

Year	Issue	Year	Issue
1948	August 1950	1961	Annual 1962
1949	Annual 1950	1962	Annual 1963
1950 & 1951	Annual 1951	1963	Annual 1964
1952	Annual 1952	1964	Annual 1965
1953	Annual 1953	1965	Annual 1966
1954	Annual 1955	1966	Annual 1967

LOSSES IN INDIVIDUAL SEVERE FLOODS IN THE UNITED STATES SINCE JULY 1902

Property Losses in Thousands of Dollars

Date *	Location	Lives **	Property
May-June 1903	Kansas, Lower Missouri, and Upper Mississippi Rivers	100	$ 40,000
March 1912	Lower Mississippi River	---	70,000
March 1913	Ohio River and tributaries	467	147,000
December 1913	Texas Rivers	177	9,000
June 1921	Arkansas River in State of Colorado	120	25,000
September 1921	Texas Rivers	215	19,000
Spring of 1927	Mississippi Valley	313	284,118
November 1927	New England Rivers	88	45,578
May-June 1935	Republican and Kansas Rivers	110	18,000
July 1935	Upper Susquehanna Tributaries	52	26,000
March-April 1936	Rivers in Eastern United States	107	270,000
Jan.-Feb. 1937	Ohio and Lower Mississippi River Basins	137	417,685
March 1938	Streams in Southern California	79	24,500
September 1938	Rivers in New England	---	37,000
July 1939	Licking and Kentucky Rivers	78	1,715
August 1940	Rivers in Southern Virginia, the Carolinas, and Eastern Tennessee	40	12,000
May 1942	Delaware and Susquehanna River Basins	33	13,000
July 1942	Upper Allegheny River and Sinnamahoning Creek Basins	15	10,000
Nov.-Dec. 1942	Willamette River	10	6,900
April-June 1943	Maumee, Wabash, Upper Mississippi, Missouri, White, and Arkansas River Basins	60	172,500
August 1943	Little Kanawha River	23	1,300
April-June 1944	Upper Mississippi, Missouri, Arkansas, Red, and Lower Mississippi River Basins and East Texas Rivers	17	82,000
Feb.-March 1945	Ohio River	18	30,000
May-July 1947	Lower Missouri and Middle Mississippi River Basins	29	235,000
May-June 1948	[1]Columbia River Basin	35	101,725
May 1949	Trinity River	10	14,000
June 1949	Shenandoah and Potomac Rivers	11	8,850
June 1950	Rivers in Central West Virginia	31	4,020
June-July 1951	[2]Kansas and Missouri	28	923,224
April 1952	[3]Red River of the North, Upper Mississippi, and Missouri River Basins	11	198,000
April-May 1953	Louisiana and Texas	12	38,959
June 1953	Northwestern Iowa	14	32,950
June 1954	Middle Rio Grande and Lower Pecos Rivers	16	19,079
October 1954	Pecos River in New Mexico	13	1,783
March 1955	Ohio River Basin	15	14,396
August 1955	[4]Hurricane "Dianne" Floods in the Northeast	187	714,079
December 1955	[5]West Coast Rivers	61	154,532
Jan.-Feb. 1957	[6]Streams in Southeastern Kentucky, Southwestern West Virginia, and adjacent areas in Tennessee and Virginia	14	58,000
February 1957	Snake River and Tributaries	---	20,500
April-June 1957	Rivers in Texas, Arkansas, Kansas, Louisiana, Missouri and Oklahoma	18	105,000
June-July 1957	Wabash River and Tributaries	---	63,000
June 1958	White and Wabash Rivers	---	57,000
July 1958	Flash Flood on East Nishnabotna River (Iowa)	19	5,850
January 1959	Ohio River Basin	---	81,921
July 1961	Flash Flooding on Small Streams in Charleston, W.Va.	22	3,238
March 1963	Ohio River Basin	26	97,600
June 1964	Montana	31	54,279
December 1964	California and Oregon	40	415,832
March 1964	Ohio River Basin	13	81,602
March-May 1965	[7]Upper Mississippi, Missouri, and Red River of the North River Basins	16	181,325
May 1965	Brazos River	---	30,802
June 1965	South Platte River Basin	16	415,076
June 1965	Sanderson, Texas Flash Flood	26	2,715
June 1965	Arkansas River Basin	16	58,340

LOSSES IN INDIVIDUAL SEVERE FLOODS IN THE UNITED STATES SINCE JULY 1902

Property Losses in Thousands of Dollars

Date*	Location	Lives **	Property
April-May 1966.	Sabine and Trinity Basins, Texas	14	$ 20,100
June 1967	Platte River Basin in Nebraska------------	---	35,275
September 1967...	Hurricane "Beulah" floods in Texas--------	---	98,239
August 1967.......	Tanana and Chena Rivers in Alaska---------	---	98,550
May 1968...........	Rivers in Northern New Jersey------------	---	166,690
Jan.-Feb. 1969...	Floods in California---------------------	60	399,233
March-April 1969..	[8] Snowmelt Floods in Upper Midwest----------	---	151,000
July 1969.........	Northern Ohio----------------------------	30	87,915
August 1969.......	[9] James River Basin in Virginia-------------	153	116,000
January 1970.......	Sacramento River Basin-------------------	18	38,120
September 1970....	Arizona----------------------------------	23	5,000
October 1970.......	Puerto Rico------------------------------	50	62,000
August 1971.........	New Jersey ("Doria" rainfall)------------	---	138,700
September 1971....	Southeastern Pennsylvania----------------	13	19,010
February 1972.....	Buffalo Creek, West Virginia-------------	125	10,000
May 1972..........	South-central Texas Flash Floods----------	18	17,500
June 1972.........	Black Hills of South Dakota---------------	237	164,947
June 1972.........	Eastern U.S. (Hurricane "Agnes" floods)---	105	4,019,721
Spring 1973........	Mississippi System------------------------	33	1,154,770
May 1973..........	South Platte Basin in Colorado------------	---	120,400
May 1973..........	Flash Flooding in Mountains of North Carolina and Southwest Virginia---------	12	29,485
June 1973........	Connecticut Basin in Vermont, Connecticut and New Hampshire----------------------	11	64,000
June 1973.........	San Jacinto Basin and small adjacent basins in southeast Texas---------------	10	62,500

* The 1966 to 1972 Annual Issues of Climatological Data, National Summary (as well as various earlier issues) contain this table which lists additional significant severe floods during the period of record.

** No entry indicates that fewer than ten lives were lost.

GENERAL SUMMARY OF FLOOD LOSSES FOR 1972 LATE REPORTS

Raymond J. Haley
Office of Hydrology, National Weather Service

Monetary losses due to flooding in the United States during 1972 exceeded those of any year since records began. In terms of 1972 dollars, the total for the year, which was put at $4,465,135,000, was more than three times the previous record year of 1951 when damage estimates totalled $1,344,667,000, (adjusted). It was also more than ten times the 21-year (1951-1971) average national flood loss of $443 million (adjusted).

The flooding associated with Hurricane "Agnes" rainfall in late June accounted for damages totalling $4,019,721,000, or 90% of the total losses for the year. And of this figure nearly $2.8 billion (almost 70%) damage occurred in the state of Pennsylvania alone.

In addition to the unprecedented property damage and other monetary losses, there were 554 flood related fatilities during 1972. This is the greatest number of any year going back to 1925, and it is nearly seven times the national average for the 47-year period.

Of the 554 lives lost during the year, 467 persons perished in what may be considered three separate flood events. The first occurred on the morning of February 26 when a coal waste bank collapsed on the Middle Fork of Buffalo Creek in Logan County, West Virginia. The resulting wall of water estimated to be 30 to 35 feet high swept down the narrow Buffalo Creek Hollow completely or partially destroying some 16 mining towns and killing 125 persons. The second occurred during the night of June 9-10 when torrential rainfall occurred in a short time over the Black Hills of South Dakota and caused severe flooding, particularly along Rapid Creek which flows through Rapid City. This flash flooding took 237 lives. The third event was the record flooding caused by the rainfall associated with Hurricane "Agnes.". Several states were affected with Pennsylvania and New York being the hardest hit. There was a total of 105 lives lost and of this number 67 were in the Susquehanna Basin of New York and Pennsylvania.

GENERAL SUMMARY OF FLOOD LOSSES FOR 1973 LATE REPORTS

Raymond J. Haley
Office of Hydrology, National Weather Service

Total flood losses in the United States during 1973, which were estimated to be $1,894,493,000, were the second highest of record. This figure, however, represents only little more than one third (37%) of the losses suffered during 1972 when damages totalled a record $5,082,217,000, adjusted to the 1973 price index. The 1973 losses were more than 2½ times the 22-year (1951-1972) average national flood losses of $712 million (adjusted).

The historic Spring flood in the Mississippi System, which affected parts of a dozen states and inundated almost 16 million acres, accounted for 61% ($1,154 million) of the total for the year. Other severe flood events during 1973 include the South Platte Basin flood in Colorado during May with property losses totalling more than $120 million; flash flooding in the mountains of North Carolina and southwest Virginia during May which claimed 12 lives and more than $29 million damages; the Connecticut Basin flood in Vermont, Connecticut, and New Hampshire in June during which 11 persons perished and $64 million in damages resulted; and the June flooding in the San Jacinto Basin and vicinity in southeast Texas where 10 lives were lost and damages totalled $62.5 million.

There were 148 flood related fatilities during 1973. This figure is well below the modern record in the United States (554 in 1972), but it is 61% higher than the national average (92) for the 48-year period, 1925 to 1972. Thirty-three lives were lost during the Spring flood in the Mississippi System and of this number, 19 occurred in the Yazoo Basin in the state of Mississippi.

* Damage estimates under this heading usually refer to losses and wages due to suspension of business, and costs of emergency protection, evacuation rehabilitation and relief. ** Most figures are based on flood damage surveys conducted by the National Weather Service, or are estimates contained in reports of Corps of Engineers, U.S. Army. A. Includes all residential. B. Includes all commercial. C. Includes all residential & commercial. D. Includes all agricultural losses. E. Includes urban public property losses. F. Includes Other Property damage. G. Includes Livestock & Moveable losses. H. Includes Rural and Other property losses. J. Includes $250.0 unclassified urban losses. K. Includes Public Utilities. L. Marine damage which includes boats, docks, fish, etc.
